Well Still looking ......Just a  little more informed .!.
Manufacture , labes , original power unit ,  cables , that sort of
things , not too high on the list !

Tops is the   TSC 12 Transmitter ... power  plug would be handy ...
hacked well depends if 'thay' used a new blade,

Just needs to  have 'all the big bits' , nice if its working ...

Can collect inside UK and poss Ireland , depands on the weight packed
~ fuel ~ etc surface mail , from outside uk possible ?

Tnx - G ..

It's an Italian ham receiver from the 60s I think, 12 American tubes,
double conversion, well made.  It followed me home from the Belton
hamfest.  Right now it's  on the Variac to see if it works.  It looks
very good but has a crack in the dial cover and needs a Geloso logo disc
for the dial.  Does anyone know of any source of parts?  This is the
only one I've ever seen.
Thanks
Hank  wd5jfr

Hello Hank:

The vfo, with logo, was sold separately and a small number of them were sold. They come up from time to time on eBay, often unbuilt. You should be able to find both parts with a semi-diligent search.

73, Colin K7FM

There's a web site dedicated to Geloso on
http://www.geocities.com/siliconvalley/pines/5440/geloso.html

At the top of the page there's a good image of the logo, maybe you could
copy it?

Well Still looking ......

A little more informed .!. Manufacture , labes , original power unit ,
cables , that sort of things , RX , not too high on the list

Tops is the   TSC 12 Transmitter ... power plug would be handy ...
hacked well depends if 'thay' used a new blade and how deep the cuts

Just needs to have 'all the big bits' , would be nice if its
working ...

Can collect UK & poss Ireland , depands on the weight packed ~ fuel ~
surface mail from outside the uk possible ??

Tnx - G ..

I didn't mention it but the G.212-TR came along for the ride. It's AM, CW only but the Rx has a product detector. The serial numbers on both are in the low 2000s so there must have been a few made. I wonder if many made it to the USA or still exist? The Tx has a good logo badge, it looks like it clear cast plastic with lettering that's relieved and gold filled. I've uploaded some pics to
http://s97.photobucket.com/albums/l237/wd5jfr/
Thanks

Handsome looking set. I have a Geloso VFO N.I.B. that I picked up
a while back for a homebrew CW transmitter project I'll get around
to doing someday :)  Let us know how it plays when you fire it up.

Pete

I just aquired a Drake R4B which is in quite good condition. I've found one problem which I am hoping may be familiar to someone, namely hum when using AVC-Off. This is appearent on CW signals or the calibrator. There is no hum when using the AVC. This _should_ be easy to track down but the schematics in the BAMA handbooks have such poor resolution that its difficult to see where the connections go. I may have to buy a handbook but I would like some assistance, if possible, before I have to do that. Its probably a tired capacitor somewhere, but _where_?

Also, does any one know of a freebee handbook that is better than the one at BAMA?

A very nicely designed receiver, but...................I purchased one of
these a couple of years ago, and it also had some rust. All of the
bandswitches were corroded/rusty, to the point where the radio didn't work
most of the time. This seems happen too often with seaside radios. I don't
know if it is the corrosive salt air or not. The only thing that was
salvageable from the whole radio was the tuning capacitor. I threw the rest
of the radio out.
It would really be a good idea to actually test this radio, so another poor
soul such as myself doesn't end up with a rusty paperweight.

Pete

Oh, the active antenna that came with it was another thing I was able to salvage from this thing. Give it a test!

Front panel is near perfect- no mods. The cabinet has some flaking that is
typical of this VFO and the SR series in general. Internal switches have
been cleaned and detent plates lubricated. No backlash. All original knobs.
Very stable.
$615 includes UPS shipping/insurance.

That sounds liker a 'hum dinger' of a set you have there ! ..... It
all depends how Drake impliment the 'avc-off' function ... is the avc
fed from a -ve bias supply , and altered by the rf/if gain control ,
to bias the vlaves off .. or dose it set the gain to max and cathode
bias one of the valves - rf ?-

could be hum on the bias pack ... or heater cathode problem when the
tubes are biased fully 'on' ? ... carrier borne hum reaching the
detector ? shold show on a 'scope' at that level ??

G ..

G ..

I haven't fully analysed the bias circuit, I just got a
decent schematic thanks to one of the members of this group.
I replaced the filter capacitor in the bias supply but I
don't think it made much difference. I am more suspicious of
a tube causing the problem. It is not apparent when using
AVC although the bias is still there. The hum is not serious
but noticable. I was hoping someone in the group had
encountered the specific problem and knew what caused it.
If/when I find it I will post back. In general this is a
very nice little receiver

Join the Drake Yahoo group- there' are guys up there that have worked on
hundreds of the 4 line and know the problems and circuits by heart.

Thanks, I'll look for it. I am a memeber of a couple of
other Yahoo mailing lists so I am already registered.

Hello all, I'm new to this forum. I may not even be in the correct forum
for a question like this, if anyone has a link for a better place for me
to go, I would appreciate it. I have acquired an old tube radio at a

garage sale. It just kind of looked at me and said "help me". I don't have any experience rebuilding electronics, especially antique stuff. I am handy with small parts and soldering. The radio is a Deforest Crosley built in 1937 and is a battery operated model. I don't really know what a B+ 135 volt battery looks like, I've never heard of anything like that. Is it possible to use a transformer to convert AC to what I need? I have ordered the wiring diagram, but don't have it yet. I am aware of issues with old electrolytic capacitors, some of the threads I have have read in this forum have made it apparent that they may have to go in favor of modern ones. That is OK with me, I'm not too concerned with keeping it all original, I just want it to work. If anyone has general advice for me for a project like this, please feel free to respond.
Thanks. Norm

Since it's a consumer radio, rec.antiques.radio+phono is the place. People can tell you things about the specific radio, and in making sure it will work.

Hey Neat;
I had a Geloso receiver once, worked Beautiful & had that Euro
styling.
Bad part was low audion & many of us tried to find out why but never
did!
```

FYI, Geloso Receivers & Xmtrs were also made in Brazil under the name
"DELTA".
A friend had a pair for sale, I shudda bought them:-(

Please do take many pictures before you work on it, so that you can rebuild it like the original. At some point, this will be a valuable investment if it is maintained as carefully as possible but not updated or "made new". Having said that, it would be very rare for a radio of that age not to have suffered some decrepitude or been repaired at some point. If it has already been hacked or has some blemish to repair, you will have lost nothing by matching something in. Replacing a capacitor, tube or resistor wouldn't be a big deal. Leaving brush marks or scratches on the chassis would be. At some point, you or the next owner could rebuild or fabricate an original part to match later. The object is to maintain the character and not to do anything out of character that isn't reversible.

I wouldn't have a problem with cross posting of projects like these as the technology of radio restoration is almost indistinguishable but for a transmitter.

Batteries were often hooked in series to obtain the voltages and it was common for a battery box containing many battery packs to take care of the various voltages. This is impractical these days, because the last I saw of these batteries was in the 80's (if you looked hard) and they were expensive and didn't last long enough. It is possible to make an AC power supply for all the voltages required. Once you have the schematic, there may even be one there, as there were undoubtedly AC models of that radio. Indeed the voltages are so common, you could easily build a much newer and efficient power supply, carefully concealed to match. Look to back issues of QST or ARRL handbooks in the library for the fast track to the technology. One popular way of doing this after high voltage transformers got scarce, was to take two filament transformers, one 6.3 or 12.6v ac to supply the tube filaments and lamps, and another smaller one connected in reverse and powered from the 6 or 12 volt to step back up to 117v ac, which is then rectified and filtered for the appropriate DC voltage. This provides isolation of the radio chassis from the house voltage. At this point even filament transformers are getting scarce. At one time there were many solutions available, but part availability has called for unorthodox ingenuity, at least until you stumble onto what you need at the flea markets.

Regarding the batteries, one of your replies was right on. It used 3 45v batteries in series for the B+. I doubt you'll have many electrolytics in that set owing to the fact that its a battery set. There may be one in the audio output cathode circuit. The schematic will tell all, of course. The hardest part will be coming up with the 1.5v for the tube filaments, again assuming they are 1.5v tubes. Fairchild has a nice and inexpensive ($3) TO-220 regulator package rated at 4 amps. One can drive it from one half of a rectified, center tapped 6.3v transformer and/or half-wave rectifying the entire secondary. Its a very cheap and easy way to get reliable 1.5v for those tubes. If the tubes are 6v types, just half-wave rectify and filter the 6.3v winding.

IIRC, Wikipedia had a good article on the history of license
requirements....

```

I found it!

I sent my FT847 for repairs to:

Vertex Standard
10900 Walker St
Cypress, CA 90630-5013
714-827-7600

This is after Yaesu told me they would not repair my 847.
The radio took a new CPU for CAT, 1.5 hrs labor for 146 plus shipping.
Fast turn around too.

They also removed the out of band mods (came that way from eBay) at my request. My son, 14 at the time, was just licensed. It would be bad enough for him to accidently piss off fellow hams. Interfering with emergency services would be a whole other matter.

Good Luck,

Paul P

Product Features and Technical Details
Product Features

- Entertainment-centric notebook PC with widescreen 17-inch LCD and stylish high-gloss finish with wave imprint, integrated webcam
- 1.5 GHz Intel Core 2 Duo T5250 processor, dual 160 GB hard drives, 2 GB RAM (4 GB max), LightScribe dual-layer DVD drive
- Quad-mode Wi-Fi (802.11a/b/g/n); Gigabit Ethernet; Nvidia GeForce 8600M graphics (up to 1023 MB of available memory)
- Connectivity: 4 USB, 1 FireWire, 1 VGA, 1 S-Video, expansion port 3 connector, ExpressCard 54/34, 5-in-1 memory card reader
- Pre-installed with Windows Vista Home Premium (with Media Center capabilities)

Processor, Memory, and Motherboard

- Hardware Platform: PC
- Processor: 1.50 GHz Intel Core Duo
- Number of Processors: 2
- RAM: 2000 MB
- RAM Type: DDR2 SDRAM

Hard Drive

- Size: 320 GB

- Manufacturer: Portable
- Type: Serial ATA

Graphics and Display

- Graphics RAM: 256 MB
- LCD Native Resolution: 17

Ports and Connectivity

- Modem: Fax / modem

Cases and Expandability

- Size (LWH): 11.22 inches, 6.7 inches, 1.65 inches
- Weight: 16 pounds

Product Description
Balance your need for productivity with great multimedia performance with the HP Pavilion dv9640us notebook PC, which features an amazingly bright, widescreen 17-inch BrightView display--perfect for multitasking between document windows and watching movies in their native aspect ratio. Enjoy movies or music in seconds with the external DVD or music buttons to launch HP QuickPlay (which bypasses the boot process). Control playback settings from up to 10 feet away with the included remote control, which stores conveniently in the ExpressCard slot. It offers a cool, modern look with a durable, high-gloss piano black finish and wavy inlaid design inspired by Zen rock gardens as well as a subtle blue backlit media control panel that responds to the slightest touch. It also has an integrated 1.3-megapixel WebCam (and integrated microphone), enabling easy video conferencing via VoIP and video IM chats.

This notebook is powered by the 1.5 GHz Intel Core 2 Duo T5250 processor, which offers a 20 percent performance boost over its predecessor while using 28 percent less power--so you get the benefit of a powerful dual-core PC plus all the benefits of mobility. It includes Intel's 4965 AGN wireless LAN, which will connect to draft 802.11n routers and offers compatibility with 802.11a/b/g networks as well. You can easily burn your home video productions to DVD for friends and family with the dual-layer, multi-format DVD/CD burner, which also includes LightScribe technology for personalized silkscreen-quality, laser-etched CD/DVD labels. Other hardware features include dual 160 GB hard drives (for 320 GB of capacity), 2 GB of installed RAM (4 GB maximum), an integrated NVidia GeForce 8600M video/graphics card with 1023 MB of shared video RAM, Gigabit Ethernet, HDMI A/V port, and multi-format memory card reader.

This laptop also comes preinstalled with Microsoft Windows Vista Home Premium, which includes all of the Windows Media Center capabilities for turning your PC into an all-in-one home entertainment center. In addition to easily playing your DVD movies and managing your digital audio library, you'll be able to record and watch your favorite TV shows (even HDTV). Vista also integrates new search tools throughout the operating system, includes new parental control features, and offers new tools that can warn you of impending hardware failures.

The Basics

- Processor: The Intel Core 2 Duo T5250 processor has a 1.5 GHz processor speed, fast 667 MHz front-side bus (FSB), and large 2 MB L2 cache. (An L2, or secondary, cache temporarily stores data; and a larger L2 cache can help speed up your system's performance. The FSB carries data between the CPU and RAM, and a faster front-side bus will deliver better overall performance.)

  The Intel Core 2 Duo processor has two computational execution cores in a single processor, providing greater system response when running multi-threaded applications simultaneously with no significant increase in power consumption. It's optimized for multitasking and is ready to support the Microsoft Windows Vista operating system. It can simultaneously run multiple demanding applications--such as graphics-intensive games or serious number-crunching business productivity applications--while downloading music or running virus-scanning security programs in the background. Some of the advanced Intel innovations of the Core 2 Duo processor include:
    - Smart Memory Access: Improves system performance by hiding memory latency, thus optimizing the use of available computer data bandwidth to provide data to the processor when and where it is needed.
    - Advanced Digital Media Boost: Effectively doubles the execution speed for instructions used widely in multimedia and graphics applications.
    - Dynamic Power Coordination: Coordinates Enhanced Intel SpeedStep Technology and idle power-management state (C-states) transitions independently per core to help save power.
    - Deeper Sleep with Dynamic Cache Sizing: Saves power by flushing cache data to system memory during periods of inactivity to lower CPU voltage.

- Hard Drive: This system offers a total of 320 GB of hard disk drive space from two 160 GB drives (5400 RPM). These Serial ATA (SATA) hard drives also quicken the pace with a higher speed transfer of data--akin to FireWire and USB 2.0.

- Memory: The 2 GB of installed RAM (2 x 1024 MB DDR2) will satisfy many users, but this notebook's two DIMM slots have a maximum 4 GB RAM capacity--perfect for high-end video editing and 3-D gaming. The additional capacity helps boost the amount of available video RAM that's shared with this notebook's video card.

- DVD/CD Drive: This multiformat DVD/CD drive is compatible with writing both DVD+ and DVD- disc formats as well as dual-layer (DL) DVD +/-R discs, which can store up to 8.5 GB of data. It features 4x DVD-R DL Write Once, 2.4x DVD+R DL Write Once, 8x DVD+R, 4x DVD+RW, 8x DVD-R, 4x DVD-RW, 16x DVD-ROM, 40x CD-R, 24x CD-RW, and 40x CD-ROM speeds.

This LightScribe DVD+/-RW drive lets you laser-etch silkscreen quality text and images on to CDs and DVDs . Your software, PC and discs work together for a no-hassle way to burn just the labels you want. After you burn content, just flip the disc over, reinsert and burn your label--anything from a simple title to a full-disc work of art.

* Keyboard & Mouse: This notebook has a 101-key keyboard and a touchpad with on/off button and dedicated vertical/horizontal Scroll Up/Down pad. It also includes two quick-launch buttons (HP QuickPlay Music and DVD).

Screen, Video & Audio
The 17-inch WXGA+ high-definition BrightView widescreen (1440 x 900 resolution) provides a 45 percent larger picture for DVD movies than a 15-inch screen. Video is powered by the NVidia GeForce 8600M graphics card, which provides up to 1023 MB of available RAM/video memory (256 MB dedicated RAM) for unmatched HD video performance on a notebook PC. With support for Microsoft DirectX 10 Shader Model 4.0 and High Dynamic-Range Lighting (HDR), it lets you rip through all of today's most advanced and cutting-edge games and applications. Experience real-time photo editing, or immerse yourself in the most complex, true-to-life gaming environments.

The Altec Lansing speakers provide exceptional sound, and a pair of stereo earbud headphones with volume controls is included. You'll be able to privately share enjoyment of multimedia with a friend via the dual headphone jacks.

Networking, Connectivity & Expansion
Be ready for the next platform in wireless connectivity with the integrated Intel Wireless Wi-Fi Link 4965 AGN LAN chip. Based on the draft 802.11n Wi-Fi specification, it offers up to five times the performance and twice the wireless range as existing 802.11g wireless. It's also backward compatible with 802.11b/g networks (commonly found in home routers and Wi-Fi hotspots) as well as 802.11a networks (which has a higher throughput, but more limited range--great for closed office environments). You also get super-fast wired connectivity, with a Gigabit Ethernet port (10/100/1000).

It also includes a next-generation ExpressCard 54/34 card slot (though no standard PCMCIA slot), which lets you take advantage of thinner, faster, and lighter expansion cards for even more advanced wireless, networking, storage, and security features. You get a good offering of connectivity options:

This guy fixes all my stuff.
http://techinfo.awardspace.com/

If the board is burnt it will still smell that way even after it's fixed,
though.

I have 3 excellent National SW3's complete with tubes and coils.  Have
42 coils and 18 tubes.  No power supplies.
These units were bought from a collector about 15 years ago and have
been in storage since then.  Moving to
South America and can't take all the "anchors".  Will sell the radio
individually with some coils but not all coils
or tubes with one radio.  Will not sell the coils without a radio.  I
can send you some high resolution photos if
interested.  Please don't ask if not really interested in buying I
don't have time to waste.  Accept REASONABLE
offers for one or the lot.  I have a fair idea of the market value so
please don't make a silly offer as has happened
when I advertised on a couple of other lists.  Thanks.  Tony  W4OI

I have COMPLETE collections of QST and CQ available. All magazines
are in excellent condition - most QST's
are in binders.   Complete means from ALL from Issue #1 thru 2005.
Collections such as this are not easily
found and becoming more rare every day so they will not be sold
cheap. If you're a serious buyer contact me
and let's talk.   Shipping would be a problem due to the bulk and the
weight but doable if necessary. Tony

I have a very good working Drake T4X-B transmitter for sale.  It's been been
in good operation on my 75 and 40M antenna.  I'd guess the physical
condition is about 8.5 to 9.  Included is a copy of ot the manual.  $195.00
u-pay-shipping.  ...............Mike, WA5MOE (979) 696-4400.

Microwave Oven Transformers (MOT's)

- have a high voltage secondary winding,
  rated at around 2800V and .5A,
  with resistance well under 150 ohm

- have the sides of the I-section of the core line-welded
  to the E-section, not meshed with it, and therefore
  relatively easy to split off by using a hack saw on one side.

I long wanted to experiment with turning transformers
into LF chokes for vacuum tube power supplies.

MOT's seem particularly apt and available candidates,
but the following considerations should apply to any transformer.

I plan on

- putting all windings in series (in-phase of course)

- splitting off I-sections to reduce saturation as DC flows

- adding magnetic shielding in the form of a thick ferrous alloy
shield belt
  coplananar with the winding, and extending well beyond its height.

Things I have doubts about:

- should the core I-section be removed
  or left in place but insulated and distanced
  from the E-section? (I saw both options mentioned)

- is the core supposed to be insulated from the chassis?
  and from the magnetic shield?

- is there an advantage in point-grounding core and shield
  to chassis, as opposed to bonding them more broadly?

```
- how do I close the loop in a ferrous alloy mag shield belt?
  bolt it?
  spot weld it?
  line weld it?
  or are overlapping layers enough?

--------------------------------------------------------------------

I hope in wise advice.

If you do not want a "silly offer" then provide a price or a price range that you are looking for. Ditto for "REASONABLE" offers. What may be reasonable to you as a seller may not be reasonable to others as buyers. While you may "have a fair idea of the market value", interested buyers may not.

Sure thing. For me, $20 is reasonable, since that is about how much fun I would have getting an old radio working and pretending it was 1930 to see what I could hear. And then sitting it under the bench to put my dirty boots on.

On the other hand to someone else that radio might be worth $500 because it is just exactly what he needs to complete his collection and besides that he never saw three of them sitting on the bench side by side.

It all depends........

So give at least a starting price if you are going to accept bids.

Rick K2XT

I would think that any "interested buyer" would know what the market
value might be or
they could do some research.  I also didn't request nonsensical
responses from people
like you who seem to hang around reflectors with nothing else to do.
Get a life.

Let me see:

1. you state that you do not want any one to ask if they are not
really interested and that your time is more valuable than your
potential customers - "Please don't ask if not really interested in
buying I don't have time to waste."

2. you imply that you have a price in mind for the lot - "I have a
fair idea of the market value so please don't make a silly offer as
has happened when I advertised on a couple of other lists."

yet when I suggest that you might provide your potential customers
(including me) with additional information so that they do not "waste
your time", you tell me to get a life.

I was interested in the lot to the point of making an offer in the
high 3 digits, but not anymore. 73's, and good luck.

I am performing an alignment on a National NC-300 using the manual found on BAMA. I am having a bit of linearity problems with in the 40m and 20M bands. That is, once the top and lower frequencies have been set the middle of the dial scale is off. 80m is right on the money (tracks the band scale well). I have not finished the rest of the bands yet. It is too late to focus.

To set the high end a variable cap is used. To set the low end an inductor is used. To adjust that inductor there is a solid wire or two depending on the band, inside the ceramic oscillator coil form. The form is about a half inch ID. You bend (oops-form) the wire like swinging a close line from side to side.

My attention has been pulled to the coils with two loops. Is one used for the low end and one for the midband?

Before I dive into all the variables I hope some one has some experience with linearizing the dial scale on this radio and would share some hints and tips.

Thanks in advance.

Paul P.

```

Just want to inform everyone that we will be attending the 2008 Florida Hamfest in Melbourne Florida on October 11th -12th.

Will anyone be attending?

You can find more information about the Hamfest by visiting -

http://www.pcars.org - click on the link in the left navigation bar
for the 2008 Hamfest.

If you would like to check out our product list you can visit -
http://www.thetubecenter.com. We will be bringing a bunch of great
vacuum tubes, capacitors, grid caps, sockets, etc.

Email us or call us and ask us to bring you a product if you are
attending, and it will save you on the shipping!

Thank You
The Tube Center Webmaster (chris)

This is the question:

Would you swap a Drake r8b for a Collins 51 S1? Why do I ask this?

I have a Drake R8B and a Wellbrook 1530+ antenna, and pick up a lot ot QRM and noise S5 - 6 so I cannot do DX, I have tried with other antennas and the result is the same.

I have read in other forums that receivers with valvel are less noiser and one owner of the Collins 51 s1 says that QRM and noises do not exist.

Do you think that it is worth swapping it?

Thanks. Any comments are very welcomed

Internally generated noise and noise that comes in the antenna
lead from external sources are two very different things. Both
are nice receivers, but the 51S1, while collectable and pricey,
isn't a stellar performer when it comes to strong signal handling.

You're misinterpreting the comments.

Your problem is noise that's coming in the antenna, and the receiver won't do a thing about that.

Even thirty years ago, there wasn't much around the average house that generated noise. But now, just about everything is computerized or digitized, and it all generates noise. All those switching supplies too, they generate noise, in some cases even with the equipment turned off. So the radio spectrum is far noisier now than in the old days. The only places that won't suffer will be out in the country, where there are few people to have electronic equipment around that generates all that noise.

The noise generated in a receiver may or may not be an issue, unrelated to this external noise problem. The noise figure of a receiver becomes increasingly significant as you go up in frequency, while on the shortwave bands it means relatively little since the "noise" generated by the sun and such are less significant at the lower frequencies. Many shortwave receivers had quite large noise figures, 8dB or so, and it never mattered, while that sort of noise figure in the VHF range would be considered awful; you'd want 2dB or so up there.

One confusing thing is that a cheap receiver with little gain appears to be "less noisy" than a good receiver with lots of gain. To the beginner, the noise coming out of a good speaker sounds bad, but it's not. My first receiver, a Hallicrafter's S-120A (the transistorized one) had virtually no gain, so there was little background hiss. When I moved to an SP-600 a year later, it sounded so noisy because there was all this hiss between stations. But the SP-600 was a much better receiver.

Michael VE2BVW

If you hear a noise increase when you attach your antenna (and I am certain
you will), then a RX with a lower MDS wil be of no help.

If you plug in the 51S-1 to the same antenna, you will likely hear the same noise level. The R8B is a wonderful receiver that has a nice noise blanker and generally a better performer than the 51S-1. It is also easier to maintain.

Colin K7FM

From a purely economic point (nothing else), especially over time, the Collins will always be more valuable than the Drake. This assumes like condition of the two.

You need to try to reduce the QRM (man made). If you can run the radio from battery and make the noise go away by killing the mains, you have something to work on. If it is really QRN (nature's noise) that's just tough. That antenna has a preamp. Not always a good thing. The amplifier will amplify signal AND noise. If you are able to selectively bypass it, you will have more options. If there is too much noise and signal, all you do is risk the extra noise generated in the amplifier. The theory behind a loop, is that you lose some signal, but you can orient it to lose more noise, so you can hear signal that might be obliterated otherwise. It is best to have more of a wire antenna, high and in the clear to catch signal at the risk of catching more noise, so that you can switch back and forth for the best reception. Even fine painted wire for stealth is better than nothing.

The fact of life, is that the ionosphere will either reflect the signal or absorb it and either you will hear it or not. QRN goes up and down. The Collins is a neat thing if you have room for both but I wouldn't swap them.

And the Collins would be a big shock to anyone who grew up with modern
solid state receivers.

Tune 500KHz, shift the band, then tune another 500KHz, shift the band
again.

Lesser receivers of the period suffered from lots of things like
not so great definition on the tuning dial, but you could tune a 2:1
range per band.

Current synthesized receivers don't have different bands for the
shortwave spectrum, it's done invisibly inside so you can tune
from the top of the broadcast band to the 30MHz with one swoop
of the tuning knob (well, numerous turns and more of them the
finer the tuning steps, but no bandswitching needed). They also
often have the ability to enter a frequency from a keypad, so
you can jump easily to the general area you want to tune.

So, get an AM radio with a loopstick antenna, walk around the neighborhood,
and see where the QRM is coming from. Then fix it.

>I have read in other forums that receivers with valvel are less noiser
>and one owner of the Collins 51 s1 says that QRM and noises do not

He doesn't have a touch lamp. If he had a touch lamp, he wouldn't be able
to use his radio at all.

It's true that radios with good filters and lots of dynamic range on the
front end are better at dealing with QRM, but if you have an issue that is
severe, you need to find it and fix it.

>Do you think that it is worth swapping it?

No, because it doesn't solve the problem.

Hi all;
I have the receiver working well with batteries, 90vdc for plates, and 1.5v for filaments, ..90v doesnt draw much I, but the I from the 1.5v batts is 300ma.
I have acquired an acopian 120 volt dc power supply,
I would like to connect the output to a circuit, (hopefully something simple)
that will give me 90v and 1.5 v.
any help greatly appreciated, I do have a good junkbox with resistors , the

old power types and 2 watt jobs,
tnx Jim kw3u
I figure why reinvent the wheel when I can be lazy and ask the experts here.

An OB3 voltage regulator tube and a resistor will provide 90V from 120V. So would a 90V zener diode or string of lower voltage zener diodes in series and a resistor.

The 1.5V could be produced with a series string of silicon rectifiers and a resistor (maybe two or three. It depends on their forward conduction voltage.) The power lost in the resistor(s) for this output voltage will be at least 35W.

For the 90V it's not a bad way to approach it. For the 1.5V it's kind of crappy but it will work if the power supply can provide enough power and you like the smell of hot resistors.

You might find the filament circuit in this design useful and the 105V output could be turned down to 90V.

http://www.dwave.net/~twomules/vtpwr.pdf

If you eventually decide to build a dedicated off-line supply for the radio this may help.

I am restoring a HQ170 and I need the "Window Assembly" p/n M26300-G2 as per HQ170A manual. Anybody know where I can find a used or new assembly? Please check out attached photo.

I am considering making one myself if I cannot find one. The existing one has some damage from wear. The left window has a chunk out of the top edge and the hole/slot where it rides on the tuning dial shaft is oversize and bent. The right window has a small chunk out of the top edge. All the metal hardware is there, all I need is to make two clear plastic windows of similar thickness with indicator line.

73,
Robert W6RQR

OM, I'll forward the schematic of the power supply I built for the complete 102E radio set, which includes the Type 139 receiver. Given you don't have the transmitter, its a bit simpler. Use your existing power supply for B+ and locate a small, center-tapped 6.3v filament transformer. Use, as I did, a Fairchild 1.5v 3A regulator. It makes the circuit a bit simpler and provides regulation, of course. FYI, the receiver will work well from anywhere from about 75 volts up to no more than 120v DC. Its not necessary to regulate the voltage, either, although an 0B2 or 0B3 VR tube may make obtaining the requisite B+ voltage a bit easier. If you'll pass on your direct info, I'll send you a TIF of the schematic and some info from an article I did on the 102E system. The info will give you the part numbers of the $4 Fairchild TO-22 regulators.

----

hi ;

i have up- dated the web pages .

1 week left .

7 filing cabinets of magazines left .

more new bargins .

some magazines are just for the shipping costs .

go to http://waltbelsito.4t.com

thanks WALT

Need 9-pin tall and medium IERC style tube
shields for 9-pin tubes.
Need a few 7-pin tall and short IERC styles as well.

Can anyone help with these? For a homebrew RX,
I don't want to pay Surplus Sales prices for this
application!

Pete

Looks like a fun project.

The schematic has similarities to the National NC300 that I am currently restoring. I heard the NC303 has some nice engineering differences that enhance it's performance.

Good luck,

Paul P.

I had an identical problem with another boatanchor receivers.

In my case the problem was with one of the anti-backlash gears driving the VFO.
The spring was not in tension enough.

Even if you could get the high voltage down far enough, the HP-23
doesn't have enough current capacity for the TR-4's three final tubes.

Hi Scott,

It's a Capehart R-390A. I'm not sure who made the PTO....I don't have anyone to help me lift it out of the case so I can look at it this evening.

I hope to have a friend help me extract it from the cabinet in the next few days...I'll try to figure out which PTO it is.

Thanks!

Derek

Don't lift it out of the cabinet, lift the cabinet off of it.  Turn it face
down on the bench, and lift up the case.

I have four analog meter movements that should fit the R-390 and R-391
series of receivers. Check it out!

Good point, I forgot there were 3 of them.

Back in the day of cheap mil surplus, we would cobble up all kinds of stuff and often add transformers and parts hanging in mid air to existing chassis cobbled together to get what we needed. Harder to find tube junk these days, but garage sales and one swap meet run will usually turn up enough junk to build something.

Never let anything keep you off the air. I have fond memories of every radio that I ever cobbled on the air. At one point I had an OLD GE Pre-Prog 250w 2m base station and 440 pre-prog and A- strip Motorolas in racks and TCS boatanchor twins (from WW2 landing craft) on 40 and 80 meters CW. Shelves of tube type audio gear, real to real. Rebuilt TV (no cabinet of course) all in my bedroom as a kid. Not real efficient but lots of fun. I wasn't paying the power bill so that issue never came up. I even modded an SCR-522 (VHF radio from ww2 fighter planes) for 2m AM with a Variable Local Oscillator and would slope detect local 2m FM repeaters before I could afford a scanner. Most junk was free from dumpsters or local hams, relatives with way too much junk in their garage. My folks were very patient with my hobbies and at one point I had entirely taken over my room and the 2 car garage with projects that were cheaply doable but barely time for half of them. My Mom's dad had done the same thing, so she actually encouraged it.

Have built several HBR's uing his chassis. He sells nice stuff and is a fair and honest guy. Get the heavieast material he has. I think it's 0.080" You need a rock solid foundation for a receiver. Be patient when you assemble it. You need a large flat surface and a good square. If it's not perfectly square and plumb you'll have hell. If you take your time, you'll have a chassis that's light years better than any of the Bud, Hammond,etc. stuff that's available.

Good Luck,
Darrell

I don't know how much of it might apply to the R-390, but Ham Radio magazine ran a couple of articles about Collins PTOs, that might provide some background information or help.

Bill Orr had an article in the December 1969 issue about the PTO in the 51J-series receivers, including if I recall properly how to get the PTO out and open it up.

Then, there was an article in the December 1974 issue about the PTO in the 75A4.

The only Collins PTOs I've looked inside of were some 1 to 1.5MHz ones I got at a hamfest decades ago. The circuit was really simple, of course the mechanics were what made them really good.

Could any one direct me to a source for an Icom Service Manual 746? I seem
to remember there were several free download locations for this material.

Or does any on have a file copy they could send me?

The one I have will only put out about 5 to 8 watts. When the RF output control is minimized the ALC indicator rises in FM mode. Any hints?

I intend to use the service manual to step through the circuits using the alignment procedure. When a procedure fails that is a section in need of attention.

Thanks in advance,

Paul P.

Never mind,

I found one.

I posted for a manual since I spent a few hours looking for a service manual yesterday. Today's Google search popped up a solution on the first page!

http://www.n7tgb.net/pages/radio/icom_docs.htm

Thanks. Paul P.

I have an old Eimac 450TH xmitter tube I keep around my shop as a conversation item (I service pro audio gear). One of my customers who is well versed in the mfgr of vacuum tubes says it is not really a great idea to have it out in the open....possibility of radiation. Any truth to this? He said to put it in a box with some unexposed camera film for a while to see if there is any radiation activity. I've never heard of this and the envelope is still sealed as far as I can tell....there's no getter in these.

Looking for the specs for the 4H4-C ballast tube used in a National NC300. I know about the 6X6 or whatever sub. I want to see why there is a 4.3 ohm 2watt resistor across said ballast tube socket. It is not reflected in the schematic from BAMA. There is a 2.2 ohm in the schematic.

Thanks Paul P.

This rings a vague bell. The filiments used in this

tube, and very many other tubes is thoriated tungsten.
Thorium, in some forms, is radioactive. I don't know how
much thorium is in the filiments but I suspect not much. BTW
some lenses made shortly after the development of rare-earth
optical glass contain some thorium and are radioactive
enough to require some care. These are mostly some WW-2
vintage aerial photo lenses. Thorium glass has some
desirable optical properties but is eventually stained brown
by the radiation. There is a bit on these lenses on the web,
do a google search for radioactive lenses.

I can't give any date, but I have a vague memory of seeing an article
that described a solid-state replacement for that ballast tube. But
it's vague enough that it may be a false memory. Usually I can remember
where I would have seen such things, and I can't this time.

I just did a websearch, and nothing turns up. But, apparently that 2.2ohm
resistor was a factory mod or upgrade. Nothing on the 4.3ohm resistor
after a quick glance.

Okay, there are two issues here.

First of all, when you turn the thing on, there are soft X-rays generated
from the electrons hitting the plate. That's a serious issue, and it's

why transmitters have some steel shielding in there.

Secondly, on a lot of tubes (and I think the 450TH is included), there is a little thorium on the filament to help knock electrons off. Thorium is an alpha emitter, and so there might be a little alpha emission there. Not enough to worry about, but if it really worries you stick a roll of Tri-X in there and see what happens.

I wouldn't open the tube up and put the filament in your mouth, and I wouldn't sleep it with it under your pillow, but as long as it's not energized it should not be a big worry.

Note that if you take a sheet of Tri-X and leave a brick on top of it, you will get a nice outline of the brick after about a week due to the radiation from unstable potassium isotopes in the brick. A pack of cigarettes will fog a sheet of Tri-X within about 18 hours. So compared with other radiation sources in the house it's not too big a deal, and the inverse square law is on your side anyway.

Cool.....thats what I was thinking. THe tube hadn't been in use for 40
plus years, and I suspect it wasn't used alot since the glass is still
clear (slight green tint visable where the plate and grid connections
are) with a few small brown streaks up near the top of the plate. I
like having it around for those who think thier KT88s are "huge
beasts". Then I can go all Crocodile Dundee and point to that 450TH
and say....no, *thats* a huge tube.

I can't find it now, but some time back I saw a video somewhere on the net of some guy that built a ~300w SE xmitter triode audio amp. The tube was out in the open with a plexiglass shield around the front while he stood in front of it playing a guitar through it. I got a chuckle out of that.

There's a group making SE triode amps out of 833As ... could be the same one ... http://www.wavac-audio.jp/he833v13_e.html

Amperite is still in business. Their home page is at: http://www.amperite.com
They have a technical data sheet and list of currently available ballast tubes at:
http://www.amperite.com/Uploads/Ballasts.pdf

I don't see the 4H4-C listed but I suspect an e-mail to the company would get you the characteristics.
A resistor across the ballast would limit the amount of current it has to pass but would also reduce its effectiveness.

I'm not sure how much x-ray is produced. These tubes run at relatively low voltage for x-ray production and soft x-rays are absorbed very quickly by air or even glass. Most of the metal in a transmitter is shielding to prevent radiation of radio frequencies.

National admitted the ballast did not work very well. In my opinion, the best approach is to rectify the 12 volts, then regulate it. That will give you a pure dc, which helps on 10 meters, where the filament hum modulates the oscillator. Also helps stability.

There is an article on the conversion to use a regulator chip.

73, Colin K7FM

Richard,

Thanks for the lead. I wrote them an email inquiring as to the specs.

Thanks again,

Paul Pinyot.

I was lucky enough to pick one up at a swap meet for 15 dollars. I took the case off and found it must be NOS. Not a scratch on it and looked unused. After a little reseating of tubes etc. It [erforms well on a discone antenna. I sure would appreciate iut if someone could steer me to a schematic? Google searches have been futile. This is the one that covers 375-1000 mcs

TIA

Tony WA6LZH

It does make you wonder who he thinks he is fooling with these "tips"
he sends out on great buys on ebay.

Oh, wait a minute, I said the word "thinks". That was my mistake.

From "The Ballast Tube Handbook" by A. P. Jacobi

4H4C, use 110/1-20V sets, 4.5-8.5V, 440-470mA,
Element connected to pins 2 and 7.
No alternate type listed.

Test Preparation Software

Pass your US FCC ham radio license test with ease. Our test preparation software serves as a training aid to help amateurs and prospective amateurs pass the
VEC's administered test. When you can consistently pass the test given by our test
preparation software, you will almost certainly pass an actual test.

Our ham radio license test preparation software uses the latest officially released VEC's approved question pools. The program breaks the test into different sub-element. Integrated into the software are illustrations and Part 97 rules pertaining to the current question. The program tracks the progress of the tests taken. Once you have mastered each sub-element you are ready for the official test.

Visit our web site at http://www.hamradiolicense.net for more information

I also have one of these sitting out in the garage, The tuning strip
is okay but the drive belt is just too far gone to be of any use.

Does anyone know where I might obtaina replacement drive belt?

Here are a bunch of parts for sale. Prices do not include shipping. I will ship overseas.

Groth TC-2 Turns Counter.........$75 plus shipping
http://members.cox.net/radiodx3/grothtc2.JPG
http://members.cox.net/radiodx3/grothtc22.JPG

Monarch 50mm Vernier Dial...$18 plus shipping
50 mm version which is 2 inches in diameter couples to a standard 1/4 inch shaft.
http://members.cox.net/radiodx3/50mmJAvernier.JPG

EF Johnson Roller Inductor.........$40 plus shipping
The max inductance of this roller coil is approximately 13 uh and this should cover 3.5 to 30 MHz. This is in excellent condition. The dimensions of this coil are 3.5 inches long by 2.5 inches wide by 3 inches high.
http://members.cox.net/radiodx3/smallrollercoil.JPG

EF Johnson Roller Inductor.........$40 plus shipping
The max inductance of this roller coil is approximately 13 uh and this should cover 3.5 to 30 MHz. This is in excellent condition. The dimensions of this coil are 3.5 inches long by 2.5 inches wide by 3 inches high.
http://members.cox.net/radiodx3/efjrollercoil.JPG

National Radio "Velvet Vernier" Type AM Dial..........$25 plus shipping
Includes Insulated Coupling
http://members.cox.net/radiodx3/nat_amdial.JPG
http://members.cox.net/radiodx3/nat_amdial2.JPG

National Radio "Velvet Vernier" Type AM Dial..........$25 plus shipping
Includes Insulated Coupling
http://members.cox.net/radiodx3/nat_amdial3.JPG
http://members.cox.net/radiodx3/nat_amdial4.JPG

National Radio Velvet Vernier Dial & Insulated Coupling....$22 plus shipping
http://members.cox.net/radiodx3/velvet_vernier.JPG
http://members.cox.net/radiodx3/velvet_vernier2.JPG

Triplett RF Ammeter - 10 Amp Maximum....$25 plus shipping
http://members.cox.net/radiodx3/10a_sqrfammeter.JPG

Weston RF Ammeter - 10 Amp Maximum....$25 plus shipping
http://members.cox.net/radiodx3/10a_rfammeter.JPG

Geared 3 Section Variable Capacitor ....$20 plus shipping
Came out of a Hallicrafters SX-71 receiver.Measures 35 pf max per section and 10 pf min. Tying the 3 sections together will give you a variable capacitor with a max capacitance of 105 pf. The dimensions are 5 inches long by 3 inches wide by 2 inches high. The shaft is a standard 0.25 inches. This would be a great loading capacitor in a homebrew VHF transmitter or in a tuning capacitor in a crystal radio.

http://members.cox.net/radiostuff9/big3seccap3.JPG

Cardwell 100 pf Variable Capacitor....$20 plus shipping
http://members.cox.net/radiodx3/cardwell_cap.JPG

Unknown 200 pf Variable Capacitor....$20 plus shipping
http://members.cox.net/radiodx3/200pfcap.JPG

Geared 3 Section Variable Capacitor...$20 plus shipping
Came out of a Hallicrafters SX-71 receiver. Measures 470 pf max per
section and 10 pf min. Tying the 3 sections together will give you a
variable capacitor with a max capacitance of 1470 pf. The dimensions are
7 inches long by 3.5 inches wide by 2 inches high. The shaft is a
standard 0.25 inches. This would be a great loading capacitor in a
homebrew transmitter or in a tuning capacitor in a crystal radio.
http://members.cox.net/radiostuff9/big3seccap.JPG

Lighted VU Meter ....$15 plus shipping
The manufacturer is unknown. This is a tested working meter. The
dimensions are 3 inches by 3 inches. The body will fit a hole that is
2.75 inches in diameter. looks better than in photo.
http://members.cox.net/radiostuff9/vu_meterB.JPG

Lighted VU Meter..........$20 plus shipping
The manufacturer is unknown. This is a tested working meter. Their is
crack in the housing which can be seen in one of the photos. The
dimensions are 2.25 inches by 2.25 inches. The body will fit a hole that
is 2.25 inches in diameter.
http://members.cox.net/radiostuff9/vu_meter.JPG

100 kHz Crystal for Receiver Crystal Calibrator...$14 plus shipping
This is a working crystal removed from a Hallicrafters receiver that was
parted out.
http://members.cox.net/radiostuff9/100khzxtal.JPG

Note that QRZ.com and http://www.kb0mga.net/exams/ has tracking tests available on line for free as do a couple of other sites. Probably the best of the license manuals are those published by the ARRL. Not free but relatively inexpensive. The ARRL books have good explanations of the theory so that you don't have to rely on simple wrote memory. Note that the questions on the above web sites are the ACTUAL questions which are found on the tests although the particular set you get is random.

Perhaps this is the wrong place to ask but I am assuming that most fans of boatanchor stuff are also interested in history. I was recently looking over the _Radio Service Bulletins_ published on the FCC site. These were originally published by the Federal Radio Commission, the predecessor to the FCC and date from the early 1920's to about 1930. In about a 1928 bulletin the requirements for the commercial licenses of the time are mentioned. At that time there was no differentiation between phone and telegraph licenses but there were several grades of license. The code requirement for the top grades was (are you ready?) continental code: 30 WPM five letter code groups AND American Morse: 25 WPM plain text. I wonder how many followers of this group could pass that now. What I am curious about is what sort of theory test went along with this code test. The top license, called something like the Extra Commercial, required at least 18 months actual experience within the previous two years and allowed the holder to be the primary operator of any kind of commercial station.

I don't know when the FRC or FCC changed the classification of licenses, actually, I think they modified them several times, but its possible that someone out there may actually have held one of these licenses or its later equivalent.

At that time there was no differentiation between phone and telegraph licenses but there were several grades of license. The code requirement for the top grades was (are you ready?) continental code: 30 WPM five letter code groups AND American Morse: 25 WPM plain text. I wonder how many followers of this group could pass that now. What I am curious about is what sort of theory test went along with this code test. The top license, called something like the Extra Commercial, required at least 18 months actual experience within the previous two years and allowed the holder to be the primary operator of any kind of commercial station.
>
> I don't know when the FRC or FCC changed the classification of licenses, actually, I think they modified them several times, but its possible that someone out there may actually have held one of these licenses or its later equivalent.

If the FCC offered the test, then somebody has to have issued a cramming manual for the test. I'd bet that National Technical Schools had such a thing. A letter to them might turn something up in the archives.

I didn't take the First Phone until the seventies, but when I took it, I answered a couple questions oddly and got called in after the test to give oral explanations. They were apparently satisfactory because I passed. Could you imagine doing that today?

A quick look at a 1928 QST shows at least four schools advertising preparation for commercial licenses plus an ad for the well known Nilson and Hornung book. It might be difficult to track down the paperwork from the schools although I have a copy of N&H from this period. It would be interesting to know just what a candidate actually faced when taking the test.

Both my original ham license and commercial license tests were taken at the FCC offices in the downtown L.A. federal building. I think I was the only candidate both times. Code first for the ham license, sending and then receiving. I had trained myself well beyond the code requirment but it was still a bit nervous time. Both tests were multiple choice and I think I remember schematics requiring some sort of completion but not sure of that. I have a feeling the 1930's tests were a lot harder.

I know the reason commercials were required to know both continental and American morse: traffic to commercial land stations was still sent using wire circuits from the traffic centers. I once taught myself American morse and had qso's with a retired railroad telegrapher. Lost it now and beside it would be different on a sounder.

The First Telegraph required a year's service at a shore station before one could take the test.

I earned my FCC first telephone in the mid 60s; took the test in Boston at the field office. The tests were all multiple choice--no schematic drawing or anything elaborate. By the end of the sixties the market was saturated with cram school wonders. We had one "engineer" that called the chief out of bed at 3AM when one of the "lamps" in the RCA transmitter went dark. Poor guy had to drive in and change on the 4-400s in the RCA 1kW night-time transmitter. He was scowling for the next several weeks :) Those licenses were good meal tickets for part-time summer fill jobs during high school and college.

My FT-990AC went west this past weekend with some apparently serious power supply and/or PA issues. After some rudimentary troubleshooting, I've elected to out-source its repair. Yaesu will no longer work on that series of equipment so I'm looking for a reputable repair activity that can do the job. Any suggestions out there? Tnx

Ward Rehkopf wrote:
> Have just purchased a Mackay 3010C - need replacement tuning strip or
> directions on how to make one. <snip>

Hi,
Congratulations on the 3010C. Sorry, I can't help on the tuning strip,
I think they are made of unobtainium. It's like a woven fiberglass,
with sprocket holes on one side, with the frequency calibration
printed on it. It is back lit, so you can read the frequency.
The tuning strip unspools from one roll, and is taken up
on another roll, like an old style typewriter ribbon.
I understand the earliest 3010 tuning strips were film, like the Racal
RA-17 receiver.

One hint: when you get your 3010C and have it standing on its side
for access to the chassis bottom, you shouldn't turn
the main tuning knob.

Turning it can cause the tuning strip to ride off its sprockets,
and may have caused the original tuning strip to become damaged.
The damage is generally widened sprocket holes in the tuning strip,
which leads to dial backlash.

There is some dial backlash even with a good tuning strip,
so you "fine tune" SSB with the variable BFO.
The tuning rate is about 100kc per revolution.

Another hint: I was unhappy with the sound of the SSB audio
on mine, a muffled Donald Duck sound accompanied the audio.
C.W. signals didn't sound crisp, either.
I noticed that if I backed off the IF gain, the audio cleared up.
It turned out to be 455kc IF energy getting to the audio preamp,
fixed by adding a disc capacitor from grid
to cathode of the audio preamp.

Another hint: the 3010C uses the same type of mechanical filters
as the Collins 75A-4. It came with a 3.1kc filter installed,
and an empty socket where a 500Hz c.w. filter could be added.
Even with no mechanical filters installed, a 6kc wide
crystal filter is built in, and adds its skirt selectivity
to whatever mechanical filter is in use.

Another hint: if your VFO seems to jump about 18kc in calibration,

look at the 6U8A VFO premixer tube. A 6U8A crystal oscillator
caused the jump, only resolved by changing 6U8A tubes.
The bad 6U8A seemed to change from overtone oscillation to fundamental
mode oscillation whenever it wanted to.

The 3010C has an unusual rf amplifier tube, an Amperex 7788
very high transconductance pentode. They are expensive,
sought after by vacuum tube audio men.

QST reviewed the 3010 receiver in April 1967.
Electric Radio magazine reviewed it in Feb 1997.

Mackay Marine was a division of ITT.

73,
Ed Knobloch

I've heard a lot of that, and a web search hasn't turned up much.

But giving some thought to the matter, Black PVC is used in electrical
tape. Also coax jacket material is PVC - unless it is direct burial type,
which would then use polyethylene.

I wouldn't be afaid to use it.

The idea with the volume control is prevent some operator from turning the volume down all the way and forgetting it and, thus, miss an important call. A few US radio sets have also done this for the same reason. I'll have to look more closely at the schematic, but maybe lowering the value of R-221 (located from the audio pot to ground). Again, this may affect the CW mode, so further checking may be in order.
  I'm sure that lowering B+ would correspondingly lower audio output but that's not the way to do it as you may lose overall gain and sensitivity? You are correct about the nomenclature. The XD6 is the combined transmitter and receiver in a single box and no individual cabinets. The 102E is both units used together. There is still some controversy, however as to when each designation is used. My second setup, modeled after an Army comms museum item, was labeled 102E. You might want to build an ac supply for your receiver and save on batteries. If you get Electric Radio magazine, there is a power supply shown in my article. If you'd like a copy, I think I have it scanned, already.

Great.

Where's Shelby?  Will there be an announcement before the next one?

The Shelby Hamfest is in Dallas NC, it's always on Labor Day weekend.
This year was their 52nd anniversary.
This was the first year in a new location, they had been at the old
site since 1980. Everyone said the event
would be way down in attendance because of the move, they were wrong,
it was much bigger than it has been
for many previous years.
Here's a link to the clubs hamfest web page, http://www.shelbyhamfest.com/
hamfest.htm

Hope to see ya there next year.

73, Ron w4ron

I have a super nice Drake L7 HF Linear Amplifier and matching Drake Power Supply. This amplifier has been a backup to the original since new and has less than 100 hours on it. It really is an exceptional find.It comes with the original manual. Price is $1350 plus shipping from 79602. It works perfectly and has full output including 10 meters. Drake did the 10 mod at the factory. Digital pictures upon request. Thanks, Charlie Hugg, K5MBX

I hope my blasphemy will be forgiven - it's for a good cause, after all.

I'd like to get myself a sturdy 50-100W CW TX,
smtg that might be taken out of mothballing
& used anywhere on the HF spectrum,
perhaps even next century.

I'm considering a solid-state rebuild of an existing military/marine transmitter.
I am not intimidated by having to reengineer every single L & C to put e.g.
switchmode MOSFETs in.

I like in the idea of putting new life in an existing BA.
Also, much of the heavy metal would be there -
switching, shields, heavy duty RF caps & coils,
and a few nice meters. And also nice, imposing looks! :-)

- A professional TX from yesteryear that would take a quartz
and put out a healthy amount of RF on the same frequenc
or a multiple would to.

- Not concerned about modulation.

- I would not need a tube complement...

- ...nor a tube-type power supply section.
(OK, maaaybe I could chop 500Vdc to make RF,
but it would be pretty extreme...).

- I suppose a push-pull design might have certain advantages,
but otherwise, the simpler the better.

- It should be available in Europe.

======== What TX should I start from? ========

I've been thinking of something like the old Marconi Oceanspan
shipboard series,
but I don't see them traded, and I am open to suggestions both on
model and source.

Also, did anybody pull off such a project?

tnx es 73 de n1jpr/i2

Hi All;

A friend has a lead on one but we don't even know what it looks like,
built-in VFO, Size, Tube layout or anything?
We read on the WWW that it was built in 6-land for a few years around
1961, uses 807 finals but nothing else as far as info!
So, possibly some has info or knows of a pic on the WWW?
This might help us!
Tnx & 73........
Rich WA2RQY/4

Anyone out there have a parts dentron glt 1000c tuner? I need the
"special inductor" or the number of windings for the 20 meter segment
of the toroid coil. Someone fried that segment of the coil and rewound
it.
Thanks,
Sonny....NN8K

Hi, Gang

If you enter the terms "hp-200 Hewlett thesis" in to Google search, one of the results is Google Books, which has some of Jim Williams' book "Analog Circuit Design". Chapter 7 of the book is an appreciation of the HP-200, and an attempt to better its distortion performance using modern parts. It's a fascinating chapter, giving a glimpse of how an expert designer thinks. Also fascinating are excerpts from Bill Hewlett's 1939 Stanford thesis about the original design.

73,
Ed Knobloch

Bill Hewlett's original patent on the Wein bridge oscillator is USP 2583649. It can be found on either the patent office site at http://www.uspto.gov or on Google patents. Google has the advantage that one can download a PDF directly. There is likely also additional stuff on the Hewlett-Packard Memory Project site at: HP Memory Project

I don't think they have the Stanford thesis there but I have downloaded the IRE paper somewhere, probably Google could help find that too.

The performance of late versions of the well known -hp-200CD could be made much better than the specs by careful choice of tubes and lamps. The lamps especially have a significant effect on the distortion. Stock lamps were aged. I now forget the exact method but it seems to me that it involved running the lamp at red heat for a few minutes and reducing temperature slowly. This probably relieved strains in the filiment. In any case I was often able to get the distortion down to perhaps a quarter of the spec. For very special applications where very low distortion is required one can reduce the feedback level. This will cut down the distortion but also makes the oscillator have amplitude instablility so there is a limit. I seem to remember an ap note covering this but its been forty years since I worked for -hp-.

Of course, the company developed solid state versions of the oscillator with better distortion and stability characteristics than the vacuum tube versions. These all are

still very servicable instruments.
Note that there were many changes made from the first to the last production and the later versions are significantly better than the early ones. The same is true of the 400D/H voltmeter. The early ones should be avoided except as collector's items, they barely met specs to begin with and were completely redesigned. Late ones will meet half specs.

Gentlemen and any Ladies,

I have a National NC300 that I will be restoring. At minimum replacing the electrolytic capacitors. What other Hints and Kinks should I be aware of before I get into this exciting restoration project?

Were there any popular mods to this radio?

Are there any particular problems like a known arching wafer switch?
Etc., Etc.

Thanks in advance,

Paul P.

Glad you brought that up. I have a couple of antique radios I would like to restore. All of them need replacements for the big can multi-section caps in the power supply. Where does one find replacements for these today? I just got a brand new Allied Catalog (I didn't even know they were still in business) but they have nothing even vaguely similar.

One of these radios is very valuable to me sentimentally as it was the first radio I ever repaired, when I was 9 years old. It is an old Philco and listening to shortwave after repairing it is probably what got me interested in electronics and radio in the first place.

Antique Electronics Supply has them, but you can scoop the insides out of
the old cans and solder new caps in there, if you want the same appearance
for less money.

I like your sign.

Good ones are scarce. New old stock dries up. There are some twist-lock still being made but hard to find in the combination you need. One way is to fudge the values or make changes in the power supply to make use of what is available. Some just leave the can in for show and put single section replacements below the chassis. Fortunately newer caps can be made smaller. Sometimes you can fit the smaller axial and pc mount styles into the hollowed out original. Hot glue and perfboard can help. I have even heard of people gluing or waxing the original around the new ones for show.

Bill,

I'll let you know how I handle the electrolytic.  Either I will restuff the
cans or place new ones under the chassis and abandon the cans in place.  See
my web site for cap can restuffing;
http://www.ppinyot.com/C/capacitor_stuffing.htm  (This  is a hobby site.
Nothing for sale).

I need a Bandswitch Knob and the Main Tuning Knob
(or a Bandspread Knob will do). The Skirt is OK.

Anyone have any in the Junque Boxe ??

Thanks, Dick, W1KSZ

I wonder if anyone here has modified a HP-23 to be used with Drake
gear?
The high voltage on the HP-23 runs about 800 volts and in the Drake
AC-4 at 650 volts, Im sure the other voltages differ from one to the

other as well.
Would like to know if there is a way to mod the PS.

Any input appreciated

Thanks for reading, Gil n2wjw

I restored one (partially) a few years ago, and that is still my AM
receiver. I actually never replaced the filter caps, but the only time
I notice much hum is if I use headphones.
There is a mod for changing the AGC so it works better for SSB, and I
did that. The S-meter still has very fast action on SSB, but I don't
hear the constant "pumping" now. If you are interested, I can try to
find that mod.
Mine had a broken crystal phasing cap that might have happened in
shipping. (I never found out just what happened)
I cemented it back together, but getting the crystal filter aligned
perfectly was a nightmare. All the adjustments interact so you adjust
one and it throws the other off. If the crystal filter seems to work
fine, I would suggest leaving it alone, or else maybe use a sweep
generator. The rest of the radio isn't hard to re-align.
I repainted mine, so it looks real good now. Luckily the front panel

was almost perfect, even though the cabinet needed a paint job.

Good luck and 73,
Al

Paul,

Yes I change the electrolytics with out of the junk box, some
reformed, some new. If I don't have the value I make one up out of
series/parallel combinations. I don't think there were too many paper
caps but if there were change them too.

Use Deoxit on the band and wafer switches but not too much.

The NC-300 was a nice radio for it's time in that it had a proiduct
detector for better cw and ssb but no agc to match. A simple diode was
added in the NC-303 to provide a rudimentary fast attack agc. I
compared the NC-303 schematic to the NC-300 and added it with great
results on ssb and cw. Add it and you will have an NC-300 +1/2!

Good luck on your project.

Tony WA6LZH

> The performance of late versions of the well known -hp- 200CD could be made much better than the specs by careful choice of tubes and lamps. The lamps especially have a significant effect on the distortion. Stock lamps were aged. I now forget the exact method but it seems to me that it involved running the lamp at red heat for a few minutes and reducing temperature slowly. This probably relieved strains in the filiment. In any case I was often able to get the distortion down to perhaps a quarter of the spec. For very special applications where very low distortion is required one can reduce the feedback level. This will cut down the distortion but also makes the oscillator have amplitude instablility so there is a limit. I seem to remember an ap note covering this but its been forty years since I worked for -hp-.

I am VERY interested in any information anybody can come with about using light bulbs as nonlinear elements, especially any good mathematical models of light bulbs and any information about proper burn-in of lamps to stabilize their characteristics.

The patent doesn't talk too much about that, and I found nothing on the HP Legacy website.

I have been trying for the past ten years to find any original work on light bulbs as nonlinear elements and have consistently come up dry. Plenty of people use them, but it seems like a lot of trial and error is involved and no real systematic modelling has been done. I'm very surprised, especially given how good HP is about such things.

Thank you all for the replies.

I printed out the BAMA schematics and the BAMA http://bama.edebris.com/manuals/ mods for the NC300. The mods are numerous. This chassis has none of them. This can be good or bad depending on the collectors desires. I would think the factory mods like replacing an unshielded wire with shielded wire would be totally collector acceptable. The mod is fixing a design flaw identified by the factory.

I dim bulb (a kin to a variac) tested and opened up the NC300 today to start the restoration. I was able to receive station but the dial is way off and was unable to clarify SSB. All tubes tested good save one. The mixer is bad. I cleaned the chassis with Clorox clean up, a tooth brush and a rag. Now it is nice and shiny.

There is plenty of room under the chasssis for new Electrolytics. Since this restoration will not have restuffed wax/paper caps I see no harm in the underchassis installation. If a collectors want a "museum" level restoration to show off the underside of the chassis then all new components would be hidden inside origonal container, wrappers or what have you. Reformation of the eletrolytic can is out of the question. There is dried eletrolyte harded on the vent hole. In my not so hmble opinion - Unless I have a published life expetancy of the capacitor or the dilectric you are asking for a recall or burned out components when that capacitor evenually dries up, shorts or burns up.

There are a lot of paper capacitors underside. They are dipped in some plastic like coating. But that does not stop the deterioration of the internal paper. Here again, I think it is best just to "shot gun" them out.

I have a habit of resistor replacement as well. This is a bit on the edge of needs to be done or not. My lesson came from an RCA AA5. I replace all caps and aligned. It played for a day and failed. I put it on the bench and found the out of tolerance resistor. It measued good along with all the rest. I repeated these steps three more times before I just decieded to shot gun the carbon composition resistors. No more problems. If I find any out of tolerance reisstors in this chassis I will go ahead and shot gun these too. The chalenge is not to uses inducive carbon film resistors in high frequency (relative to the resistor) circuits like the oscillator and mixer section. I found that in radios that recieve less than 18 mhz all is ok. Any thing above that then non inducive resistors must be maintianed.

More later, and thanks again to all whom contributed.

If you want to follow along I will be posting my progress on the web site at www.ppinyot.com. It is not there yet.

Paul P.

You really ought to swap with someone to avoid bastardization.

There must be a schematic of the HP23 on BAMA. There are Drake T-4xB manuals for free there too with the supplies. It looks like a plain old voltage doubler. You could add a choke in the lead of the common leg and it might drop it to where you need it and improve regulation. The other voltage is 250v vs. 275v on the Heath. You might replace that choke with a resistor. The bias would just need to be adjusted. Then you still need to make a cable. Another way is to Mod the Drake for 6146B and get rid of the sweep tubes and never worry about finding replacements ever again. I also ran across a sheet on that. It would be kind of sacrilegious though. I never liked radios with sweep tubes, but my R-4B was my favorite.

I hadn't tried Clorox before. I would worry about salts appearing. Do you flush with distilled water after that?

Not Clorox bleach, Clorox Cleanup. It is a spray cleaner similar to 409.

If you use Clorox bleach on aluminum, it will etch it and eat it away.

I think you are going to have to do some old fashioned
research :-) The IRE paper describing the circuit is at:
http://www.hparchive.com/Manuals/HP-200-IRE-Article.pdf   I
can send you the PDF if you like. It does not go into too
much detail about the nature of the variable resistance.
Hewlett's circuit is discussed in a number of electronic
text books of the time, for instance Terman's later
editions. The "ageing" I described is from memory and I
don't remember the source. It may have been an internal -hp-
document or I may have been told about it. I got very
interested in the circuit while at -hp- and tried to find
out what I could. Unfortunately, I left my notes there when
I left. I will see what else I can come up with.

Note that tungsten filiment lamps had been used for other applications around this time, for instance, the first (AFAIK) commercially available volume limiter, made by Western Electric, used a bridge of small lamps as the regulating element.

I worry about those type of cleaners leaving acid or base or solvent residues, funny smells. There have been radios I ran through the dishwasher and pulled it out after the rinse and dunked it in hot distilled water, followed by LP air and bake at 130 for a day. I used to refurb telephones that way too. Dishwasher is hell on decals though.

Years ago, when I worked for Hewlett-Packard, our

method of cleaning equipment was to strip it of anything which would be hurt by water, meters, dials (in some equipment) sealed transformers, etc. Then it was washed with a paint spray gun loaded with warm water and plain dishwashing detergent. After washing it was rinsed with plain tap water and then blown out with compressed air. It was then baked for several days in an electric oven set for about 130F. One can also use a brush to help during the spraying part.

The reason for removing sealed transformers was that our experienc was that they often were not really sealed so that moisture could get in but couldn't get out again so there were frequent failures once power was applied. Open frame transformers got through the process without trouble.

I am also concerned about the long-term effects of residue from some of the new "magic" cleaners. Plain hand dishwashing detergent seems to work about as well as anything and seems relatively safe.

```

A friend of mine has a Variable Frequency Oscillator Unit 0234A/FRT-24, and a Frequency Shift Keyer, KY-45/FRT-5. Both carry Serial Number 1.

They are part of a Collins AN/FRT-6 40kw CW/FSK/FAX transmitter system. http://www.transmitter.be/col-anfrt6.html

This friend has no computer access, so he asked me to research the units. He has had them since 1975. They are both in very good condition, with only dust and tarnish from the ages.

At this point, he is ready to sell them to a serious collector, and would appreciate having some advice on how to find manuals, and possibly, interested buyers.

I'm planning to go to the Collins Collectors Group, but if there is interest elsewhere...

Hi everyone,

I have an R-390a. When tuning "through" a CW signal, the CW signal warbles and is distorted. Once I've stopped tuning and set the audio response to "NARROW" and the bandwith to about 200hz,, the signal sounds like a pure DC note.

A friend of mine who services lots of boatanchors including the R-390a says this is normal. He says I've got the RF Gain set too high and that's causing the signal to be distorted. I'm not so sure. Even with the RF gain set lower, I still hear the warbling and distortion as I tune "through" a CW signal. If I turn the RF gain *way* down, I don't hear it (but I don't hear the CW signal much either).

AM reception is just fine and SSB reception using the BFO is just fine...no distortion or warbling as I tune through a SSB signal.

So...my question for those of you that have R-390As or know them well, when I tune "through" a CW signal, should I hear a nice DC note all the way through or should it warble and show some distortion.

I *am* using a matching transfomer with my 8 ohm speaker.

73 and thanks for any help you guys can give me!

Derek

I use an NC-300 as my main receiver for AM.

Replacing the frequency determining L-C network of V3,
the second converter, with a crystal (like the NC-303)
is worth the effort. Then IF will stay in alignment.

You should hear a nice pure tone that changes pitch smoothly as you tune...
no warble.

The AGC and all that is fine, because you don't hear warble when you tune
the bfo knob.

The warble could be caused by the PTO needing a lube job, or it could be
caused by the gear train for the main knob needing cleaning and lubing.

The main tuning knob should tune smoothly without any "gear" feeling...
when was the last time I used an R390A that felt that way!

Chuck

Derek,

What you describe is a common problem with PTO. There is a small "finger"
that rides on the shaft near the front of the PTO. There are one or two
small screws that hold the finger in place. Remove it, clean it and the
shaft with something like DeoxIT and reassemble. I don't remember if any
grease is recommended but a conductive lubricant would probably help. It
should definitely NOT warble when tuning through a signal like that.

By the way, you will probably need to remove the PTO to do this. If so, be
very careful not to lose the Oldham coupling spring and if you do turn the
PTO shaft, try to remember how far (how many turns, etc.) you turn it and
put it back in the same position before reassembling it or your dial
calibration will be way off.

73,
Barry - N4BUQ

Being somewhat off center, I'd obsess about a means
to tie that LC network to the BFO, get them to track,
and call it variable passband tuning.. But I am not
wrapped too tight.

Pete

Depends on your PTO. Who made your R-390A? Some model PTOs are better
than others, and some will wobble while being tuned.

Yeah, and to not address shipping in the auction. . . I don't bid on
anything that does not address shipping costs.

He has it listed as a transceiver because it IS a transceiver. I have three
here, and have restored two others- and I must say his auction is for the
cleanest one I have ever seen.
As for listing the P.S. separately, this seems to be standard procedure.
Many BA collectors have HP-23's, 117XC's etc that they use interchangeably
on these rigs, so the factory supply may or may not be required. If I did
not need the supply, I sure woud not want to be paying shipping on it.

I had wondered if there was some confusion on the part of the previous
poster, since "Galaxy" nowadays seems to be a brand name for CB type
things, though I have no idea if there's any connection to the original.

Off hand, I couldn't think of any transmitter from the real Galaxy.  They
had that really fancy receiver in the late sixties, the R-350 or whatever,
and they had transceivers, but I can't picture any transmitters.

    Michael  VE2BVW

Hi Michael,

I don't know of any TX either. The R350 and R1350 are both fine receivers,
but no stand alone TX that I am aware of.

In later years, the CB industry hijacked the Galaxy name and continue to
churn out "10M" rigs.

Thanks for squaring me up. It's surprising there are no designated knobs on
the front for receive functions, not even a RIT, but a peek at the schematic
makes it clear.

I have often felt this may have been an oversight on Galaxy's part, that
perhaps the AF and RF gain control text was left off the silk screen- and
simply never got added. Or, As you can see, the controls are so close to the
top that there is no room at the top for the text. They barely had room to
sneak in the "mic" text between the mic gain and RF gain controls.

Now that I have found my "keeper" BA transceiver- a Hallicrafters Cyclone
and remote VFO, I'll likely be selling my Galaxys' as they no longer seem to
get used.

Hello to the BA group. Sorry for the intrusion, but I hope one of you might have information on this older solid state amplifier. It covers 160 thru 10 and is rated at 800 watts out. That is all I can find so far. I haven't been able to find a manual or hookup info. If you can help, please reply to me direct. Thanks in advance. - Larry

Larry,

Back when K6MYC ran Mirage/KLM they announced several HF amps including the
HF100800 (100 watts in and 800 out). Mirage built a few (less than 10)
prototypes but never could get FCC type approval. Most stayed on the West
Coast. I saw one or two sold on Ebay and west coast swap nets. You might
try K6MYC at M2 (the beam folks) for more info.

Dave K4JRB

Hi Walt,

Do you have the April 1984 CQ magazine?

IIRC, it's the one with the Zimbeam article on Pg. 40.

I gave mine away and regretted it since.

Cheers!

I have one complete, as-new 102E system up for sale. I have two of them and will keep but one. Included is an AC supply for both the receiver and transmitter. This system comes with all the field packs, mic, headsets, key, cables, book (in English), hand crank generator, antenna, interconnection cable, etc. and some spare tubes. Also included are a field speaker and VSWR meter. This particular system was featured in Electric Radio magazine and is currently on the air. Included also is the ER article and the alignment and modification information. The price is $400 and can be seen/operated/picked-up in the MD/DC/VA area. JPEGs if interested. Possible delivery/meeting within 150 miles. de K3HVG

I have acquired a Johnson T-R switch and during testing at 3.5+ MHz. and about 100W into a good dummy load, with the receive port terminated with 51 ohms I'm seeing an initial level on the order of four volts peak before the 6BL7 shuts off and reduces the level. Is this normal? If not, what is normal?
Thanks. 73, Bob AD3K

Bob,I haven`t used one of these in years ,But, I think that 4 volts at
rec terminals would be acceptable ..At 4 volts on rec terminals not
enough current would flow to do any damage to the input circuit..High
voltage to rec terminals ,like lightning surges etc  are the ones that
do damage.. GL   Harold W4PQW

Yes. I was triggering the scope on the transmit RF and looking at the RF on
the output of the receive port across 51 ohms. 73, Bob AD3K

That about +16dBm. Shouldn't do any real harm. Healthy signal but
non-destructive.

Now that you're reassured about receiver safety, please let me know
about your experiences with that Old-timey switch.  Years ago, I used
a similar one with my Hallicrafters HT-37 and Drake 2B.  I found that
the Xmtr's resonant tank circuit produced a null that went through the
T-R switch, and pulled down the 2B's sensitivity. I eventually
abandoned the Electronic switch for a relay.

Jerry, W9NPI

You seem to have an ageist problem, mate! I'm 68, and after major
hospitalisation am LESS greedy than ever before! Please bear in mind that
you may well need a walker and bifocals in later years. You will want to be
respected. I agree partly with your original point, but as so often it is
spoilt by your age bias. Bias against old age is probably the least logical
atttitude one can have as the perpetrator hopes to reach it himself/hersel!

```

Hello all

Glad to see this ng is still flourishing. I featured it in a book about the internet that I wrote in 1996!

I am keen to establish contact with other Australian boatanchor enthusiasts, especially since an AR88 is one of the things I'd love to get, and the freight from US may be a tad high! Anyone know a source/ng/etc?

Tnx

Jerry,
I've seen references to an article in QST about changing the length of the
coax between the transmitter and the switch when that happens. I used a
homebrew version of the T-R switch in the early to mid 70's with a Valiant

II and HQ-170A and never noticed a problem. But then I don't remember ever checking to see if the receive sensitivity went up when I detuned the tank circuit. If I run accross the information about which issue contains the article giving the analysis, I'll post it here. One thing that can be a problem when using the T-R switch with modern amplifiers that aren't class C is that amplifier noise will get into the receiver if the amp isn't biased off during receive. I've seen this on the scope while doing tests using my JST-245. I'm planning to use it with a Collins 310B, so noise shouldn't be a problem.

> Bob Spooner wrote:
>> I have acquired a Johnson T-R switch <snip>

Hi,
Don't forget to include a low-pass filter
between the electronic TR switch
and the antenna. I got c.w. thumps in my stereo system
when I tried operating without a filter. I assume TVI would
be a problem without a filter, also.

The Johnson TR switch also works well when placed between
a separate receive antenna and the receiver. It actually
has a good noise figure, and provides some receive gain.
It works very nicely with a Collins 51S-1, due to its
50 Ohm output to the receiver. The 51S-1 requires a 50 Ohm
antenna for its front end tuned circuits to work as designed,
so a random length receive antenna can provide disappointing
operation otherwise.

Be careful about burning your hand - the Johnson TR switch
runs hot!

73,
Ed Knobloch

Hi MoiInAust

Why don't you join the "Oz-wireless" Yahoo group that covers collecting
in Australia from domestic through to ham or commercial. Also the HRSA
collectors society might help too. See http://www.hrsa.asn.au/

Simon

FYI

Just a reminder to those that are not aware there is an Antique Radio
Auction at
Alderfers Auction House in Hatfield PA on August 28, 2008.

http://www.alderferauction.com/contents/upcomingdetails.aspx?EventId=1000

There is alot for everyone, a black Neutrowound, Philco Portobar radio,
black dial Zeniths, Zenith Bomber,
tubes, riders manuals, Sams Photofacts, Ham radio receivers, Military radios
(R-390A's and R-390's)
transisstor radios, novelty radios, And much more. Closer to 300 or more
lots.

GM,

I am a new ham interested in CW and would really like to find an
operators manual written before the topic of CW started to be diluted.

I would prefer a 1st or 2nd edition.

Do you mean a Radio Amateurs Handbook? If so look at this group, some have been advertized in the last couple of weeks. The books may be helpful if you want to build CW transmitting equipment but its very simple (one of the virtues of CW). If you want to learn code there are a lot of resources on the web. One is the code practice files available from W1AW, the ARRL headquarters station. Practice at speeds from 5 WPM to 40WPM is available along with the text. There are also a couple of good code practice programs available free. Do a google search for G4FON. This program will teach you code a letter at a time and can translate any text file into CW. Also search for Teach 4 another good program that works a bit differently. These programs help you learn the code by sound rather than trying to memorize letters. This is the best way to learn it.

I thought the question was clear.

The Handbook had to cover everything, so it could never cover
it all in depth. You'd get a copy of "How to Become a Radio Amateur"
to learn the basics, and maybe build that first regen receiver and
single tube transmitter, and learn the code.

If you needed more help, you'd buy "Learning the Radiotelegraph Code";
I never had a copy, I don't know how it compares with more recent
books about learning the Morse code from the ARRL.

You'd buy the Handbook next, to cover technical stuff in more detail.

Then you'd buy the mobile manual if you wanted to go mobile, or the SSB
manual if you were really interested in SSB (especially in the early days
when they covered theory of ssb better than in the later ones that were
mostly construction articles), and you'd get the VHF manual if that was
your interest.

If you were mostly interested in operating, you'd get "Operating an
Amateur Radio Station" which was sort of an extended version of the
"Operating a Station" chapter in the Handbook. I never saw one in
the old days, but my impression was that it was a relatively slim,
like the rest of the topic-specific ARRL books. The current one
is terribly thick.

That's the one he wants, to read up on operating CW when it was a much bigger part of amateur radio.

The old books have the advantage that they are current with the era. The state of the Handbook varies, since every time something new is added to the hobby (and thus the Handbook), something else gets cut. There was a long period when SSB got short shift, because the initial surge of SSB was passed and there seemed to be an assumption that everyone knew the basics. Likely also the rise of commercial SSB rigs helped. Then building changed, and a lot of people started building QRP ssb rigs and the ssb chapter improved. Solid state and even computers came along and helped to better implement the phasing method, and whammo, the phasing method that had been mostly a footnote in the Handbook for many years suddenly became more detailed.

A good, comprehensive answer but I don't think the original question was quite as clear as you think. Also, the name of the book requires some clarification: you may be right that he wants "How to Operate an Amateur Radio Station" but I am not sure how old a first or second edition would be. In any case the older ARRL handbooks cover a lot

of CW stuff like handling traffic etc. Being a long time CW
person myself perhaps it seems simpler to me than to someone
new. I certainly encourage anyone to wants to practice this
art.

I just spotted an ad for this in a 1947 ARRL handbook. I remember also seeing them listed in an Allied catalogue or maybe it was a Radio Master. Has anyone here actually seen one? There must not have been many of them made, assuming they were made at all. The illustration looks more like "an artists rendering" than an actual photograph. They were evidently intended to be a super-deluxe receiver. Anyone know anything about these?

Hello Richard:

Osterman's 3rd Edition has a little information. Apparently it was made between 1945 and 1947 by the Allen d. Cardwell Manufacturing Corporation, a family held corporation. It shows that it is 18 tubes with a rurret type display.

A Google Search came up empty. Usually, you will find rare radios in personal collections. The fact that I find none in personal websites is a bad sign.

Never have seen one.

I think you need one for your collection.

73, Colin K7FM

I have a exceptionally nice Yaesu FT-101E HF Transceiver for sale.
It is from an estate was not used much. It looks near new and still have the
plastic on the front panel. There is one nick in the paint on the left side
of the cabinet, otherwise it is near mint.
I brought it up slowly with a variac and cleaned the switches and controls
and took each plug in circuit board out and cleaned the contacts. It works
great, very sensitive, stable receiver and full output power on each band.
It has the Optional CW filter installed. It also has the Speech Processor.
The Original Manual,AC and DC power cords, and the Yasesu Hand Mic are also
included. Price is $425 plus shipping. Thanks, Charlie Hugg, K5MBX

With Shelby time on us, beware of those boatanchors who swoop in early
buying trinkets that immediately are sold on- line   as treasures
ready for service-

GM,

Michael you were spot on to understand what I meant.
Thank you.

I thought my subject line would have been very clear.
Since it is exactly the title of what I am looking for.
And since I was not sure if I could locate a first edition
I left the option open for the second.

I did find a 1966 first edition. I am excited.

Richard how come you don't put your call letters
in your signature?

See you on the bands

Probably because he didn't think it important to the subject at hand. And, perhaps he thought that if you thought it important, you would have looked WB6KBL up on QRZ.com.

Hi Harold,
I did not see WB6KBL any, sorry.
But now I see that there is a view profile option.
Not quite used to reading Usenet on Google.

Harold here is something you might enjoy

I don't know about Richard, but I keep my call letters
off of my internet activities because the FCC database
is freely searchable, and has my station address in it.

There are some real nutcases out on the internet.  Do you
really want to make it easy for one of them to come and
visit you?

-Chuck

Chuck,

That's a good point.
I am used to just using it in closed groups.
Google does expose us to a much greater audience.

Richard,

Thanks for the advice, I have already learned the code,
Used Chuck Adams code course, I hear great things about
G4FON but being a MAC and LInux user, it is unavailable to me.

There s a new KOCH method Web site though that is good for
continuing accuracy training
http://lcwo.net/

I am in the processes of building a transistor qrp rig and trying to
decide on which of the glow plug projects
looks the most promising. Then there is always the T4 I have tucked
away. So many projects.

My main thought now is to increase my knowledge of the operating
procedures of CW and as Michael
pointed out the newer editors of ham radio literature are giving CW  a
second class rating.

See you on the bands.

73, Harry

Hi Harry,

What you are posting this on right now is not a closed google group!

It is usenet, one of the oldest widely used ports (119) on the internet.

Everything you post here is completely uncontrolled, unregulated and available to anyone worldwide.

Google happens to archive everything that shows up on usenet.

I find that many of those sorts of programs work just fine under linux using wine. And those that need DOS work just fine under linux using dosemu with freedos. You will probably need to adjust dosemu's pseudo processor speed for proper function.

-Chuck

Fred, What's wrong with that? It may be a trinket locally, but a
treasure across the State or the Nation. And the "Middleman" makes it
available.

Nobody is holding a Wouff-Hong at anyone's throat to make a bid. (Or
is the Rettysnitch sharper? Only T.O.M. knew.)

Jerry, W9NPI

Using wine!? I find that *everything* works using enough wine. Preferably a
good Australian red!

I know a little about the Cardwell company. Long ago their main competition seems to have been Hammarlund and National for capacitors. I don't think they made any other receivers but don't know for certain. They can't have made many of these guys. Shortly after the Model 54 was announced Hammarlund began advertising the SP-600 and Collins the 51J and 75A models. Hammarlund's first ads for the SP-600 shows a drawing of a receiver which is recognizable but is very different in detail for the receiver that made it to production. The concept was a RX with calibrated band spread and push-pull audio. It evidently got seriously redesigned between the first ad (see the 1948 ARRL Radio Amateur's Handbook) and the production model. I suspect the virtues of the double-conversion competitors would have made it difficult for the Cardwell RX. It sure would be interesting to know some more history of both the Cardwell and SP-600 receivers.

GM,

Michael you were spot on to understand what I meant.
Thank you.

I thought my subject line would have been very clear.
Since it is exactly the title of what I am looking for.
And since I was not sure if I could locate a first edition
I left the option open for the second.

I did find a 1966 first edition. I am excited.

Richard how come you don't put your call letters
in your signature?

See you on the bands

73, Harry
W9HGO -SKCC #4647

A lot of my e-mail goes to people who wouldn't know what it was. I should create an alternative sig. I've been adding my call occasionally to posts here and to other ham related places.

Hi Harold,
I did not see WB6KBL any, sorry.
But now I see that there is a view profile option.
Not quite used to reading Usenet on Google.

Harold here is something you might enjoy
http://tinyurl.com/665o7u

73, Harry
W9HGO -SKCC #4647

     I'm on the QRZ database. My call dates to the 1960s
when I was first licensed. I let that license lapse and just
recently got re-licensed and asked to get my old call back.
Its a clumsey call but somehow I wanted some continuity.

Chuck,

That's a good point.
I am used to just using it in closed groups.
Google does expose us to a much greater audience.

Richard,

Thanks for the advice, I have already learned the code,
Used Chuck Adams code course, I hear great things about
G4FON but being a MAC and LInux user, it is unavailable to
me.

There s a new KOCH method Web site though that is good for
continuing accuracy training
http://lcwo.net/

I am in the processes of building a transistor qrp rig and trying to decide on which of the glow plug projects looks the most promising. Then there is always the T4 I have tucked away. So many projects.

My main thought now is to increase my knowledge of the operating procedures of CW and as Michael pointed out the newer editors of ham radio literature are giving CW a second class rating.

See you on the bands.

73, Harry
W9HGO -SKCC #4647

Well, I am not too happy about either current CW or phone procedures, especially the business of signing _only_ your call when calling other stations. How the heck is the other guy supposed to know he/she is being called?

CW procedure for conversations is pretty simple but if you want to handle traffic the older books will be helpful. I also suggest looking at some of the older commercial license books for the radio-telegraph license.

BTW, I might as well ventilate on a favorate sore point of mine. That is the use of dits at the end of transmissions. This originated in the spark and arc days when the letter C in wire morse (.. .) was used to indicate a station was clear of the frequency. Maritime operators used to split this as a kind of friendly sig. The station _signed with_ would send the didit part and the other station send the last dit. It was never part of "shave and a haircut" as has been alleged on some current sites. Sometimes the most trivial things can bother you:-)

Anyway AR SK and didit dit.

Hello Richard:

I think the Cardwell company was owned by another company, which was owned by the Cardwell family. At some point, during the demise of Hammarlund, that company purchased the Hammarlund assets.

The specified audio output of the Cardwell receivers is high enough that it was probably push-pull. So, if you ever find one, the audio will probably be good.

I just had a thought about searching for this elusive receiver. Check the various manual sources. If there were a few radios made, there must have been a manual floating around. Fun to see one.

73, Colin K7FM

Mine, which I carefully guard, certainly is -- but it's in two places where
I voluntarily put it, not thinking about the web. But, you would have to
know the number to find out who I am <G>

I think so too. I'm not quite sure what happened to either Hammarlund or Cardwell. There is some Hammarlund history on the web. At the time the Cardwell RX went on the market a number of receivers had relatively high quality push-pull output stages. The Hammarlund Super-Pro for one and a couple of National receivers, I think the SX-28 and SX-32 had push-pull amps. I can testify as the owner of a BC-779 that the low distortion helps even with CW since distortion magnifies noise. Those having receivers with an external connection to the detector may get surprize if this is connected to a high quality audio system. Most of these connections have DC on them so a series capacitor and a resistor are necessary. An SP-600, for instance, will let you hear all the clipping from the processing on AM broadcast stations. There WAS, dear children, high-quality AM in the dear, dead, long ago before being the loudest kid on the block became the objective.
(I have created an alternative signature, here it is)

Found data. From September 1946 QST, page 117, full page ad for the
Cardwell Fifty-Four.

1. Full turret R.F. Section
2. Wide coverage with coil strips to 40 mc - extra strip goes to 54 mc.
3. 100 and 1000 kc calibrator.
4. 5 degrees of selcetivity.

5. New noise limiter.
6. Band spread dial calibrated directly.
7. 10.5 inch direct reading dial.
8. Temperature compensated oscillator.
9. (This is an interesting one). Mechanical control shafts are brought out back of set for linkage to other units, such as excited or transmitter. Can you imagine the tracking nightmare for the homecuilder?
10. All aluminum construction (still weighs 78 lbs).
11. Push-pull class A-B output (8 watts).
12. 18 tubes - all miniature.
13. Panoramic adapter jack.
14. Threshold squelch.

They claimed they had a technical bulletin.

In the October 1946 issue, there is a full page ad with a drawing of the receiver. The technical article was signed by Mack C. Jones. Said a technical bulletin was available.

Cardwell ad for November and December 1946 was for other products.

Will research 1947 next.

Colin K7FM

And, as we move on to 1947, there is no ad in QST by the Cardwell Company.

I would take a wild guess, based upon my experience over the years, that the company spent so much money on development of the CR-54 that they finally threw in the towel and that none got out the door. I have seen what appears to be photos, though, so there may be one that was made. But, the technical bulletin should be around, so you can drool a bit.

I thought that was the common form, certainly in homebrew articles that seems to predominate. Yet, the commercial ones are likely to be standalone, so one doesn't have to fuss with the transmitter.

I've never used one, and never given it much thought. I thought the suckout issue was when it was connected to the plate of the transmitter, but that's more likely because the suckout issue was a common issue with TR switches, and I was more familiar with connecting it to the plate of the transmitter's output tube.

One thing, it certainly was not uncommon to see articles where the TR switch included a stage of amplification and a tuned circuit of some sort.

Also, when connecting to the plate, they'd use a very small value capacitor, and one article I just checked said to use an even smaller value for a higher power transmitter. That's going to cause some sort of loss, indeed that article mentioned one might need to add a tuned circuit to the TR switch to compensate for the loss.

I can add some information, based on research done back in 1980 by H. L. Chadbourne of La Jolla, CA. Quoting from a letter of his to me:

"...I saw the name Ray Morehouse with call letters attached to one of these ads [the QST ads] , so I looked him up in a recent callbook and wrote him. Had a very nice letter back. He'd worked for Cardwell from 1924-1947. He had a little on the receiver, but referred me to Moe Joffe in Los Angeles for more. Moe was directly in on the project.

...Allen D. Cardwell...toward the war's end...wanted to broaden the product line. He talked with Grenby Mfg. Co. of Plainview, CT about some sort of joint venture, with Cardwell doing R&D and Grenby as the manufacturing arm. Grenby had started in 1940 and during WWII made mainly parts for Pratt & Whitney. It was a sort of machine shop operation. However at one point Lockheed gave them an electronic assembly to make, and they liked the work, so decided on it for postwar. Hence the Cardwell discussions. But the two firms could not reach agreement and the talks ended by Grenby buying out Cardwell and moving the firm to Plainville. Mack C. Jones, who had been an engineer with Raytheon during WWII, was hired by Grenby as Ch. Engineer, and he suggested the 54 receiver project. Moe Joffe was under him.

"I had a fine phone conversation with Joffe and hope some time to interview him in person. He said the 54 was a very advanced set, but was not put into production because of its extremely high cost, $700 - $800 a unit. The market did not seem to be there at the time--possibly again, the huge supply of surplus put a damper on new sales. Joffe eventually went on to Squires-Sanders and their communications receiver projects."

I have Morehouse's letter here also; he said he didn't know what became of the 54 prototype.

Alan

Yes , that was as far as I went , made a dual gate fet t/r switch, but
it needed a tuned cct , did work on the low z side but was down in
gain ...

Hi,
You might want to look up the QST article "Your Novice Accent",
which appeared in Nov 1956 QST, a reprint of which was once sent
to newly licensed hams by the ARRL.  I think it was reprinted
in Dec 1990 QST.

73,
Ed Knobloch

Very interesting and more than is known about some other projects. Note that the cost of the SP-600 and 51J receivers was up in the this range. The 51J is advertized in the 1950 edition of the ARRL Handbook at $875, a veritable fortune at the time and the SP-600-JX was also up around $900. However, I think both had a market base in military sales and civilian sales were just extra. It would be interesting to know more about the Cardwell receiver. Evidently it was single conversion which would have put it at a disadvantage in comparison to the Collins and Hammarlund products. There is an ad featuring the Cardwell 54 in the 1947 edition of the ARRL Handbook with a fairly large illustration but I can't tell for certain if its a drawing or a retouched photo. It might be a photo of a prototype or possibly a mock-up. If anyone has a Radio's Master or Allied or other large catalogue of the time please

see if you can find this rx advertised there. I know such an
ad existed but don't know what year. The question, of
course, is whether the receivers were actually available,
the above post, and lack of any actual receivers, suggests
they were not.

I am more familiar with its predecessor the SP-200 and 210. The SP-400 is essentially identical except it covers the range of 540Khz to 32Mhz rather than the 2:1 frequency range bands of the earlier models. It contains the broadened out RF stages for the broadcast band of the standard SP-200 and the shunt-fed RF of the high frequency model that went to 40Mhz. Shunt feeding the RF makes it slightly more selective which is desirable for reducing image response in the highest band. Otherwise the 400 is the same receiver. At the time the 200 was made it was probably the best receiver on the market. I used a BC-779 version as my original station receiver. I modified it to use an electron coupled LO with voltage regulation. I later returned it to the original configuration and found that the RF gain or AVC would cause serious freqency pulling. The cure for this is a voltage regulator. The ECO can be made to stay put despite considerable variation of B+ and filiment voltages but it had too low an output and loaded the tuning circuit differently than the original causing some innacuracy in calibration. I think a regulator on the LO and possibly on the mixer screen will fix the voltage drift in these guys. Otherwise they are very nice. Hammarlund had a patent on the type of crystal filter used in their receivers. The Hammarlund filter does not detune when the phasing control is adjusted and has a much wider range of bandwidth than the original Lamb type filter used by National and Hallicrafters.

Electronic switches might not have the isolation you would prefer.  With a
single band you have the luxury of hanging a stub on the RX port to short
the input during TX  Otherwise, something should do that fast enough.  Since
there is 100w pep and I assume you measure 4v pp that is 16/51= .314 w pep
so:

10 log 100/.314 = 25 dB isolation.  Not real swift.  I would want better
```

than 35 dB Isolation. Even more for QSK. I wouldn't want to wait for the
RX to recover. I have equipment that burns out the input protection above
.25 w input (ave.)

You might not have trouble with a tube RF amp but...

The problem with a stub is that you still have to disconnect it somehow during receive, right? I want to work full break in without listening to a mechanical relay. From my tests, I've found that the T-R switch attenuation isn't linear - higher power levels turn the switch off faster and produce more isolation than low power levels, as would be expected with an active device that used a sample of the output signal to drive a grid negative for switching. My old Valiant II had an output of 275W for CW and isolation was no problem for the HQ-170A receiver. I could hear my transmitted signal and tell whether it was clean or not. Of course, the AGC on the 170A might be better than the older generation NC-125 and NC-173 I'm planning to use. The T-R switch is rated for up to 4KW, so it was just loafing even with 275W.

Hi, I bought the receiver a type 139 with everything, bag, books,
headphones,
etc in new condx at a fest this year, and have a ball with it.
  the rubber headfones are too tough after a bit so use my kenwood hs set.
Cant imagine someone with them on for hours in a jungle,!
  anyway works good and I have one question,  I made up two 45v batts for
the
90v b+ and bunca d batts in parallel for the filiments.  the volume control
doesn't
crank the volume down enuff in my opinion, any mods or should i experiment
with
changing the batt voltages?
   I believe the 139 plus the xmtr gives the 102E designation.

You can avoid direct current from flowing in the filament transformer used as an output transformer by using a choke with sufficient inductance to act as a load, then capacitive coupling the filament transformer to transform impedances only. That way, the filament transformer is only used with ac.

This method is often used with modulation transformers, to prevent dc from saturating the core of the modulation transformer.

73, Colin K7FM

Yes, but it IS possible to to cut a gap into an existing EI core
transformer.

The problem is that when you do it, ALL of the transformer parameters
will change.

There is actually a Racal manpack mailing list hosted on Yahoo. You may
want to join it and ask there.

Incidentally, I wouldn't mind an MS934 either... so if you have two of them
and sell one to Graham, let me know about the other.

No, the DC currents sum to zero. That derating is only required when
the transformer secondary is poorly balanced.

You know, I have remained silent on this subject for many years. But
finally have come to the conclusion that a majority of the ham
population is beginning to lose it. I have been licensed for over 50
years, and am over 60 years old. I still buy, sell, trade older
equipment. There are so many times I have seen this subject discussed
that it really irritates me. If you want a piece of gear, and can
afford it, but it! I can truly say that I have paid more than a piece
of gear was worth, but on the other hand have bought things that I
thought were under priced. So in the long run, it all evens out. I can
still remember back in the 70's that I bought a Hallicrafters SX-115
for less than $200.00. A year or so ago, I watched one go for well
over $6000.00. So, as one of the posts, the less there is of a given
piece of gear, the  higher the cost. One of my pet peeves is the guy
```

wanting a service manual copy for the cost of postage (maybe) when there are many sources for manuals for sale. I recently took on an old FT-101EE and found a complete service manual for $22.00. Without it I probably would not have been able to repair the rig, and have a very unhappy ham on my hands. Yes, I'm on a fixed income, but if you need something buy it and stop crying. Just my thought of the day!

73,

Mike-K5VSE

You know, I have remained silent on this subject for many years. But finally have come to the conclusion that a majority of the ham population is beginning to lose it. I have been licensed for over 50 years, and am over 60 years old. I still buy, sell, trade older equipment. There are so many times I have seen this subject discussed that it really irritates me. If you want a piece of gear, and can afford it, but it! I can truly say that I have paid more than a piece of gear was worth, but on the other hand have bought things that I thought were under priced. So in the long run, it all evens out. I can still remember back in the 70's that I bought a Hallicrafters SX-115 for less than $200.00. A year or so ago, I watched one go for well over $6000.00. So, as one of the posts, the less there is of a given piece of gear, the higher the cost. One of my pet peeves is the guy wanting a service manual copy for the cost of postage (maybe) when there are many sources for manuals for sale. I recently took on an old FT-101EE and found a complete service manual for $22.00. Without it I probably would not have been able to repair the rig, and have a very unhappy ham on my hands. Yes, I'm on a fixed income, but if you need something buy it and stop crying. Just my thought of the day!

73,

Mike-K5VSE

Mike

I gladly pay fair prices for everything I buy.

I simply made a personal observation that I have found the older a
person becomes, the more greedy and self-absorbed they become.

It will remain one of life's ironies that those who have seem to
horde,and those who do not give.

Please read the lines and not between them

73's & Happy Hording .. Fred

How does that occur in a half-wave circuit?
It is a series circuit. The half-wave
rectifier produces a voltage across the load that is
a complex waveform with both a DC and an AC component.
Since it is a series circuit, the same situation exists in the
transformer secondary.  DC sums would be zero with a full
wave rectifier or a full-wave voltage doubler.

I agree, you win on a few and lose on a few. But those of us who have the test equipment and the knowledge to do our own repair do have a large advantage and can most often win anyway. For example, I bought an R-71A at auction a few years ago for about $200. It was much worse than advertised. Clearly, someone prodded and poked around in it in the belief that wiggling components with the power on might fix it, and failing at that, flipped it on eBay. With the full documentation and a pile of decent test gear it's up and running for less than $20.00 (and a few parts from my QST junkbox :^)

3922 most every night, hey? If I can relocate the post from the teeny-bopper who is down on us old people, I might requisition his call for an evening and drop in on 3922 to say hi. Might as well get some use from his post.

I was thinking of using a toroid to provide the LO injection to a balanced mixer, using a trifiliar wound transformer driven by a cathode follower. Has anyone tried that scheme? On the other hand, adding a cathode follower means that stage could also be used as a phase inverter and the drive taken from the cathode and plate, eliminating the need for a broadband transformer. Anyone have experience with either means?

More ignorant nonsense.

Maybe people react to you negatively because you piss them off.

Well, you did not say what you meant by "lose it."

  I have been licensed for over 50
> years, and am over 60 years old.

I have been licensed close to that and also am over 60.

> I still buy, sell, trade older
> equipment.

As I have seen in the last year, and in the decade or two up to now, the=20
quality and quantity of ham gear decline at hamfests--and as my=20
junkbox and test equipment (including three tektronix oscilloscopes)=20
has become adequate--my buying of gear has fallen off considerably.

  There are so many times I have seen this subject discussed
> that it really irritates me. If you want a piece of gear, and can
> afford it, but it! I can truly say that I have paid more than a piece

> over $6000.00.

$6000 for an SX-115? Pretty good catch for the seller. I'd like to hear=20
the buyer's rationalization for paying that kind of money. Certainly if=20
one's kid were taken by kidnappers, then I could easily understand high=20
figures for ransom. Maybe collectors who did some heavy dreaming all their=
=20
life, or who are filthy rich and can drop that kind of money with no=20
effect on their resources for an SX-115. Maybe auctions, which "play"=20
human psychology on one bidder against another bidder who bids back, in an=
=20
upward spiral to way "over the top" prices exploit the same mentality that=

=20
plays lottos operated by governments (to moneyharvest suckers to help=20
their spending programs). Me, I can't justify anything near that kind of=20
price. Yeah, I've bought stuff at hamfests for more than the stuff was=20
worth, but nowhere near $6000 for SX-115 levels. That is definitely crazy.

So, as one of the posts, the less there is of a given
> piece of gear, the higher the cost. One of my pet peeves is the guy
> wanting a service manual copy for the cost of postage (maybe) when
> there are many sources for manuals for sale. I recently took on an old

> something buy it and stop crying. Just my thought of the day!

Some of my wisdom for the day: For a decade now, I have been going to used=
=20
book sales where the price is usually a dollar for a hardback. My other=20
hobby in my old age is reading history books, mainly ancient and medieval.=
=20
Considering how many hours of "entertainment" (not to mention education=20
from a non-fiction books) and enlightenment I get from each of nearly=20
200 books I've read in the last ten years for a total investment of $200,=
=20
my opinion is that I'm getting much better bang for the buck on the books.
I've spent a fair bit more on ham gear over the same period and have spent=
=20
quite a lot less hours "playing with the knobs and switches." Another=20
inexpensive but entertaining hobby is watching the birds and squirrels in=
=20
my birdfeeders and hummingbird feeder. Probably about 30 cents per day and=
=20
wife and I get live, commercial-free, no viruses/spyware, no-pet-problems,=
=20
low maintenance entertainment.

Sure, anyone can take thousands to tens of thousands of dollars (or use=20
debt) for foolish expenses. And, there are guys out there that look for=20
suckers every day.

$6000 for an SX-115?

When rich people bid up at Christies or Sotheby's, its for the purpose of
driving up prices so they can donate at the end of a "run up" period and
get a big tax write off, not because they _want_ that Picaso for bragging
rights. Or, they also play "high-roller" social networking for entre'.

Y'all think what you want.

Was looking at a smallish ex-microwave oven transformer other day and
wondering same. using one at much lower current as single ended OP
transformer?

Typical small scrapped m.wave transformer. Thousand watts at 115 volts
means primary handles around 8 to 9 amps.
Secondary at say 2000 volts handles 0.5 amps (500 ma.) Suppose we were
to use it at say less than 100 ma. plate current; to avoid saturation?
Note:

If the output of the transformer is around 2000 volts RMS (before DC
voltage doubling etc.) and has a 115 volt primary it has a voltage
ratio of around 17 to one. So a (single ended) tube impedance match
from an 8 ohm speaker of about 2400 is possible?

That could be suitable for a triode connected (non P-P) output tube?

Also wondered if other power transformers could be used at low DC
currents to avoid saturation etc. and perhaps cathode connected?

For example a centre tapped 700 volt power transformer (350-0-350)
would have a voltage ratio to its 6.3 volt winding of 111, hmmm!
That's a very high impedance ratio!

And it's 6.3 plus 5.0 volt winding (11.3) it would have a voltage
ratio of about 62, also very high!

But to its 115 volt winding the voltage ratio is 700/115 =3D 6.1 for an impedance transform of 37.

Thence 37 times 8 =3D 296; adequate to match the cathode follower
impedance of P-P 'grounded' plate OP tubes?
With DC currents in the cathode circuits tending to cancel each other?

Just playing with thoughts at this stage!

Note: Seen use of those ex. m.wave transformers for battery chargers,
their primaries are pretty rugged and a 12 volt secondary can be not
too many turns of something capable of quite a few amps!

No, I haven't tried that particular idea, but here are some thoughts:

Are you using the transformer to the grids or the cathodes? Are you going go broadband or resonant? If broadband, are you going to be able to generate sufficient voltage before you run into problems with excess inductance?   Have you considered loading the output (if you're going to the grids) and just giving it excess drive?

I would expect (but I haven't tried it) that a phase inverter would have all sorts of parasitic problems at RF, so you'd have trouble making sure that your phase was really 180 degrees out and that your amplitudes matched -- any mismatch of phase or amplitude will unbalance your mixer, to the detriment of your carrier suppression. I would expect (but I don't know) that a center-tapped transformer, either resonant or broadband, would give you better balance.

Do you need to implement control loops in software?
"Applied Control Theory for Embedded Systems" gives you just what it says.
See details at http://www.wescottdesign.com/actfes/actfes.html

Tim

Non resonant, and the drive would be to the deflection electrodes.
LO range is between 3 and 30 MHz, which made me think a
trifilar wound balun would work, provided the deflection plates
were terminated with load resistors. I need several volts drive
on each grid. The trifilar winding would help balance, I assume?
Squires used an untuned transformer in his
receiver (7360 mixer,) but information on the actual circuit is
hard to come by.

Pete

Hi,

The Squires 7360 front end design appeared in Sept 1963 QST.
I can't find my copy, so I don't know if it includes the info
you seek.

73,
Ed Knobloch

Got it today Walt, thanks!

Walt is a great guy. Doesn't pad the postage and has no problem shipping
to VE land :-)

Cheers,

--
Gregg

Well, it's solid state, but long unsupported, and it weighs a ton, so I figure it's appropriate.

WD4JKH came up with modified firmware that allows manual frequency setting from the front panel for the S990 control heads. There is some info on it on http://www.kb0nly.net/s950_s990_modifications.html. I downloaded the binary and burned a bunch of EPROMS, but find I have burned about twenty more EPROMs than I have radios.

So if you have a GE Delta set with an S990 head, give me a ping and I will send you one of the things. I'd like to trade for a microphone or handset for the Deltas, but I'd take a couple bucks instead and if you can convince me you're a starving college student or something, I'll just send you one.
They seem to work fine.

Well, in one respect, vintage equipment is a real bargain.

This past year I purchased a set of Heathkit SB-series amateur radio
=93twins=94 for the collective price of about $350. If you include
related expenses need for getting the set on the air, the total cost
was probably about $500. That=92s in current dollars (2008).
Accounting for inflation, this is equivalent to $80 in 1968, a year
during which the same and equivalent items could be purchased. Going
the other way, I=92d say that in 1968, the same Heathkit station would
have cost about $650, which in today=92s dollars is about $4000. So,
even if I had been ripped off and paid twice what I did this year, I
still would have paid a low price.

FS: Collins Round Emblem 516F-2 Power Supply with Cabinet that has been through Bud Whitney's, K7RMT, shop. Bud did all his mods to this one including relay, solid state replacements for the tubes, voltage dropping resistor, all caps were replaced with new high grade capacitors. The Chokes, L1 and L2 have been replaced with new ones and the power supply has been tested to assure that it is meeting all factory specs. The Power Cord has also been replaced with a new one. This is a very late Serial Number unit in the 62K range. The Round Emblem cabinet is CCA Excellent. Pictures are available upon request. Price is $475 plus shipping.
Thanks, Charlie Hugg, K5MBX

Am a bit older than most who have mentioned it here!!!!
No problem; on eBay for example; see an item and before bidding
decide,
a) Do I really need/want it? Or am I just being nostagically old and
foolish.
b) If yes; what sort of cost limit am I prepared to go to. If bidding
is 'brisk' do I want to go a 'little more' either in dollars or a
percentage?  Usually that answer 'no'.
c) Forget about it. Noting however the price  that it eventually sells
for future info.
d) End of discussion.

Yup--this is essentially the same approach I use for making Ebay
purchases.

Generally speaking, if bidding is brisk on an item I=92m interested in,
I=92m not inclined to get in on the action. And that=92s not a problem,
because all I have to do is wait and sooner or later it pops up
again.

scott im sorry but i never used any forum before im looking to convert
some 990 heads for our club and need the chips i have audio tubes to
trade or cash cell 516 4399583

Nostalgia sometimes wears rose colored glasses :)

I've bid foolishly on things from my radio past, only to discover
what I remembered and the reality of how bad some of
those radios really were are two different things.

I've been going thru an early 50s S-76. So far I replaced
a weak 6AU6 and a 390k resistor that read about 1.3 megs.

There may be some bad parts hiding in the subchassis that
holds the 6BE6 second mixer and some IF cans. How hard is it
to remove and replace the subchassis? Any hints?

The double conversion reduces image response compared to
the the S-40. This becomes a problem above 10-20 MHz
depending on the Q of the RF coils and how well the radio
is aligned.

The 5 selectivity choices on the S-76 would help receive
weak signals.

The S-40 is a much simpler radio and easier to align.
The S-7 alignment procedure calls for a 50 KHz signal
which is not provided by most signal generators.

The large S-meter on the S-76 provides a multimedia
experience which has no counterpart in the S40.

============
There are paper capacitors in the subchassis that must be replaced.
There is no easy way to remove the thing: just disconnect the wires
going to it (mark them well!) and unbolt it.  It is really no big
deal, just go through the steps. --Ed

If it's a 50KHz final IF, then that would tend to give better
selectivity. After all, at that frequency you can get plenty of
narrow bandwidth without anything more than a few IF transformers.

It's not just the selectivity, but you get better shape factor
with just the IF transformers at 50KHz as opposed to 455KHz.

And they wouldn't go to the trouble of dropping to 50KHz unless
they were seeking better selectivity than 455KHz would offer.

And given a 50KHz IF, they didn't have much choice but to go

to double conversion, since a 50KHz IF would mean either lousy
image rejection or a lot of tuned circuits at the signal frequency.

I am thinking of using a 6ES8 in a Pullen mixer for a HBR
receiver project. Ted used the second harmonic of the LO
for the bands above 7 mc. I'm wondering if the Pullen
mixer is suitable for this sort of LO scheme? The original
design used a sharp cutoff pentode in the mixer with light
capacitive coupling for LO injection to the grid. I had hoped
to used a balanced mixer, but it is entirely unsuited for this
application. Any advice on the Pullen's suitability?

I am in the process of repairing a National NC-88. I am in need of the antenna input inductor L1, P/N SB:1517. I have been told the same P/N is also used in the National NC-98. If you need a photo to give an idea as to which coil assemble I am in need of, I have 3 pictures that I could email. Short of finding a correct part does anyone have the inductance values of the coils mounted on that P/N?

Hi,
Just picked up one of these.

Can anyone point me to a source for the owner's manual? I have a copy of a
copy that is in rough shape and it is missing information

Also- What is the difference between a 5 and a 5A

Thanks and 73

Carl

You have this listed as a Transceiver, but I don't see a receiver section.

Why include a 300 Hz. Receiver CW filter with just a transmitter?

By the way, it's really greedy of you to have a separate auction for it's
required power supply.

There's a downloadable copy on www.royalsignals.org.uk as File 598,

"File No. 598   Instructions, Marconi CSR-5 Radio Receiving Equipment,
 Type 110-930 RCN Patt. No. 3A/107"

follow the instructions on the webpage to get the download link and
the password to read/print the file. (You'll need Acrobat Reader V9.)

>Also- What is the difference between a 5 and a 5A

No idea, but there's a circuit for the CSR-5A on the same site as
File No. 26 "Marconi Communications Receiver model CSR5A Circuit Diagram"

(Note: non-members of the Yahoo group can only request one document.)

Chris.

I don't know where you're getting the idea that someone who sells something at what others are willing to pay, is somehow being greedy. Anyone has a perfect right to sell something he owns for as much as the market will bear. He may well need the money to buy food, repair a car or to pay for medical care.

In the case of boatanchor radios, some are desirable; others are less desirable. They aren't making them anymore. The supply is limited. The demand is there. No one has an obligation to cut you a deal because you don't have the money to pay the going rate. If someone chooses to do so, thank him profusely.

You might want to reflect on the effect that venting your spleen might have in future. A guy may be tempted to cut you a break and may suddenly remember that you're that guy who accused folks of being greedy.

Dave K8MN

Obtained a Drake R4-B at a recent hamfest and interested in the
production date. The serial number is in the high 11 millions and is
followed by an "R". I would also like to know what does the letter at
the end of the serial number mean?   K4wys@cox.net

Odd no one here has picked up on one really good reason to get a Vanity callsign. If you contest, there is a world of difference between my original callsign, KB3EIA, and my new one, N3LI. CW is big, yet voice is also enough to make a difference.

I just watched and waited until a nice reasonably short call came up, then grabbed it.

I do have a bit of trouble explaning to some of the locals who think there has to be some deep meeaning to teh vanity call.

Other: Hey, I see you got a new callsign!

Me: Yup!

Other: I don't get it though, what does it stand for?

Me: nothing in particular.

Other: Then what dod you get that one for?

Me: Contesting.

Other: Huh?

I have aquired a Loudenboomer amplifier with out power supply. Could some
give me some hints on where to start building or acquiring a power supply
for this unit? The first problem I have encountered is the amps and volts
of the plate transformer.

Thanks,

Paul P.

Paul,

I have a non working supply and amp. There is no tube and one of the 50 watt
resistors is broken in half. I do have two replacement resistors I got from

Newark Electronics. Where are you located? The shipping may make if uneconomical because of the weight and packing. The supply has had the 866 rectifiers removed and solid state devices installed. Also the filament transformer for those tubes has also been removed. I can send a picture or two if that helps.

let me know what you think.

Some time ago a wrote to this group asking about replacement parts for the S-36 dial drive. The reason was that the small spur gear which is on the main tuning shaft split. The split was such as to lock up the whole mechanism. No parts were available alghough one fellow suggested a place that might make one. After investigating the dial mechanism I decided to see if I could repair the gear in place. It seemed worth a try since the receiver is constructed in such a way that removing the dial drive requires substantial disassembly. Well, I was successful! I was able to move the spur gear on its shaft and get some slow curing epoxy resin on the knurled part of the shaft where the gear was originally press fitted. I used a long nosed Vise-Grip plier to clamp the gear in place and also compress it so as to close the split. The split occured along one of the teeth. This all took some careful alignment of the parts in order than the gear was in the right place for the dial stop mechanism to operate properly. The gear seems to be working fine and the RX is back in business. Since I removed it from its case I've taken the opportunity to do a careful cleaning and will make sure there are no bad caps hiding away, etc. While these are not wonderful receivers from a performance standpoint they are still interesting and are decorative if not terribly useful:-) Unfortunately, the neither the IF or FM detector bandwidth is wide enough for modern FM broadcast stations although it doesn't sound too bad.

I have somewhere the original manual for this thing but its in a box somewhere and I can't find it. I was able to find manuals on the web but I am curious as to how the RBK-13 version differs from the RBK-12. There is also an RBK-15 but that has an additional, RF stage, untuned, to reduce oscillator leakage.

My main point in posting this is to show that sometimes makeshift repairs do work and not to give up when you run across some antique that _looks_ unrepairable, it may not be.

Hello Richard:

Repair of a radio, using what is available and by a method not envisioned by
the designers grants you a free pass to call yourself a true ham for one
more year.

You get a special award of merit for applying that much effort to a radio
that is not good for much, other than to get it running as intended then
putting it back on the shelf.

I hope I can one day apply that much energy into my WERS transceiver, which
transceives on 112 mc, more or less.

Good work.

Colin K7FM

Hi All,
My XYL fell in love with the Marauder after viewing a mint one in a
friend's shack. After 38 years of marriage I have learned to usually
get her what she likes hi hi.
So I am looking for a excellent++ Marauder if anyone wants to part with
it.

The Vanity callsign ... beautiful ...
I live in Italy ... in Italy the possibility of Vanity callsign and personalized license plate ... and many other things, does not exist! This is very ugly :-((

In the depths of my heart, I feel American ... and not just for these things, of course!

I hope one day to be able to come to live in the U.S., this is my great dream, I hope it will be, sooner or later.

God bless the USA

Hey Jerry;
I bought one back in the early 70's from the original owner who built
it perfectly es was Mint-o.
Let me tell you, it was a dream, too bad it was so big.
Never the less, I'd like to find another, cause now, all I have is big
rigs:-).

Thats one rig I never had, hardly even remember watt it looks like.
I certianly wud like to see a picture of one.
I thought the NCG rig by Panasonic was rare, the KLM takes the cake:-)

Thanks for the complement :-)

I'm not really a collector and like things to work rather than be just display items. It was also a challenge.

Hallicrafters stuff is always interesting. They were good at meeting market needs, sometimes quite innovative but mostly quite conventional in design, rarely best of class but very often very good values. The one outstanding area is styling: mostly quite sexy looking, maybe the reason one sees H equipment so often as props in old movies.

I thought about this when I applied for my original call. Its clumsy but somehow I was trying to recapture something I felt I had lost so I applied for it. Probably lots of short calls, better on the air, available. Mayber someday I will change it again but right now I'm happy to have it again. I was also able to get call plates again. Just got them a few weeks ago. Actually, one of my work mates had call plates and dropped them. I think he just didn't want people to know he was a ham. There are so many vanity plates in CA now that I wonder if they are even noticed any more. Anyway it's an interesting game trying to figure out what some of them mean:-)

I held my original call, KA3QBQ, for seventeen years, then developed an interest in CW and found it to be a bit long. So I applied for a shorter one and received my first choice, K3WQ. At the time, the =93preferred=94 call signs=94 (1x2 format) were in short supply and going fast, so that provided additional incentive to apply. Also, I wanted something close to my original call, and the new one has three characters in common with the original.

Paying a fee at renewal is irksome, but of course I=92ll do it. I=92d be glad to pay a lifetime fee based on, say, my age, but that won=92t happen under the current law. Oh well.

I have always wondered if Hallicrafters was responsible for much more than we give it credit for. Originally, SX meant that it was a Hallicrafters with a crystal filter, which was the deluxe model.

I think Hallicrafters became the model for manufacturers in Japan, and some of the early Japanese radio successes used X in their model number. Then, when cars came out, many had X or SX in the name. Perhaps these model numbers can be traced back to the success of the Hallicrafters line?

I'd like to hear someone having tried to use a power transformer as output transformer for the single-ended final stage of a tube communications receiver (power 5W, maximum, frequency not higher than 4,500 Hz).

As a matter of fact a plain power transformer with a 220V primary winding and 6V secondary winding would well match a 4-ohm speaker to a 5400-ohm plate load.

Basic questions:

1) does the DC current flowing through the transformer create problems? (do proper audio tranformers have a gap in the magnetic path to avoid saturation?)

2) would a typical transformer work up to 4500 Hz, while maintaining the expected impedance ratio?

3) would modern tranformers wound on a toroidal core offer better performances?

Unfortunately, proper audio tranformers are getting scarce these days.

Thanks and 73.

If it were a push-pull stage, it would be easy to say yes. You can do it with some transformers, not with others. The frequency response won't be wonderful, but it will be fine for communications work.

But with a single-ended stage, forget it. You need a transformer that is designed for impressed DC. You might be able to take a filament transformer and cut a gap in the core, but the result will not be predictable and it will take a lot of trial and error to get it right.

>Basic questions:
>
>1) does the DC current flowing through the transformer create problems? (do
>proper audio tranformers have a gap in the magnetic path to avoid saturation?)

Yes, massive ones.

>2) would a typical transformer work up to 4500 Hz, while maintaining the
>expected impedance ratio?

Many will. Some modern transformers won't... the Talema toroids have very poor high frequency response, deliberately to reduce power line trash from getting into your power supply. Most cheaper E-I core types will work.

>3) would modern tranformers wound on a toroidal core offer better performances?

Depends on what the core is made of.

>Unfortunately, proper audio tranformers are getting scarce these days.

Tony, this has been discussed numerous times on the AntiqueRadios.com forums. Yes, it will work, and apparently it works quite well by all reports. The problem is core saturation, as you suspected. You will probably get a bit less audio (before clipping) than you anticipated for a given core size. If you have a few filament transformers, it might be well worth your time to experiment and try it for yourself. Since most filament transformers are designed for secondary currents in amps, it is logical that they will handle a watt of audio without much issue.

Increasing the gap between E and I core laminations will to reduce saturation will dramatically reduce the low frequency response.

A 6.3V filament transformer will work but will be far from ideal. Far
better to take one from an old valve broadcast receiver.

I haven't done it, but it was a pretty common trick to see in the
magazines in the old days.

At least one article pointed out that if you started with a 400Hz
transformer, which were common in surplus from aircraft, you'd likely
get better frequency response where you needed it.

Thanks everyone for the replies.

However no one touched the issue whether the proper output transformers have E and I laminations arranged so as to create a gap (i.e. like non-swinging filter chokes).

I would not like having to disassemble an audio transformer just for the sake of determining whether there is a gap in the magnetic path or not.

Buying audio transformers is not cheap today:

- buying in the US implies a minimum shipping charge of about 30$ (international USPS rates have gone crazy. Forget UPS or Federal Express)

- buying on e-bay not easy either! You'll find yourself within hordes of esoteric hi-fi aficionados prepared to pay almost any price for plain things. If you wish to buy a Silver Rock audio transformer (http://www.mantrasound.it/AC_components/AC2.htm) be prepared to pay at least 4,200 Euro (about $6,300 with the US$ now getting stronger).

A balun and an attenuator[1], hence the cooling fins.

It works on the principle that a dipole 8 metres up will give better[2] results than a vertical rod near ground level, despite the attenuator.

The attenuator is there to reduce the reflected power caused by mismatches over the fairly wide frequency range used and the fixed length dipole.

Bear in mind it's for military use at relatively limited ranges and not designed for any kind of DX work.

(The technical manuals are available in the usual place.)

Well, Kodak also liked X in names, usually indicating an improvement. An example is the developer Microdol-X. Originally called just Microdol an anti silvering agent was added to prevent a sort of fog common in very fine grain developers and the X added to the name. RCA did rather the same thing, examples are the 77-D and 44-B microphones released in improved models with an X added.

I think Hallicrafters was a master of marketing. Bill Halligan found a niche in making affordable equipment for hams and SWLs. The stuff always looked well styled. Originally he used names like Skyrider. That's what the S in the model numbers means. The SX-28 was a Super-Skyrider with crystal filter. Hallicrafters also used some advanced technology in a couple of places like the Lamb noise blanker in the SX-28. Unfortunately, it didn't work very well in that embodiment although similar noise blankers with separate noise antennas did work well in other applications, for instance the blanker supplied for the Collins KWM-2 transceiver.

Hallicrafters was also one of the first companies to produce single side band equipment for the amateur.

I think sometimes features got ahead of performance. I have somewhere (I wish I could find it) a WW-2 vintage military communications technical manual which has a survey of some available receivers in it. There are charts showing spurious responses of three or four receivers. Among them are the SX-28 in its military guise and the SPX-200 Super-Pro. The Super Pro chart has perhaps two spurs, namely the expected image responses while the SX-28 chart looks like a cornfield. Of course the Super-Pro cost almost twice as much as the SX-28. BTW, the X in SPX also means it had a crystal filter, which was optional although I've never seen a Super-Pro without one.

BTW, I wonder if anyone out there has had experience with the Hallicrafters version of the SP-600? I am curious how its performance compares with the original.

If my info infers what I believe it does, the R-274 (nee SX-73) was the first of the line. The Hammarlund SP-600/R-274( ) came later as they beat out Hallicrafters for the follow-on contracts. I have both receivers but prefer the Hallicrafters. Tuning is much smoother and the SX-73 has all the normal features of a general coverage receiver. I do not, however, have a clue as how they stack up regarding responses. I have heard rumors that there was a Hallicrafters R-274 "B" version of but the contract number is the same as the "original" R-274. I suspect this was merely a simple production change of a couple of components (capacitors) rather that a substantive design change.

It would be interesting to see when the Hallicrafters project began. The Hammarlund SP-600 was first announced in 1948 but the advertizing features a drawing of what was probably either a mock-up or prototype. Also, the details in the ads vary in important ways from the production receiver. The first SP-600's came out about 1950. I think some of the changes were due to Hammarlund's realizing that the main customer would be the military. I am not sure of the date of the SX-73. The SX-73 is not a clone of the SP-600. Its a different design in many respects but meant to meet the same purchasing specs.

As far as the dial etc., a properly working SP-600 has one of the smoothest tuning mechanisms around. Hallicrafters may be as good but the SP-600 is so good that its unlikely a different design would be significantly better. I also don't know what you mean by "normal features". Both receivers have about the same features and there is nothing missing from the SP-600.

One improvement Hallicrafters made was to have filiment regulators. The SP-600 is quite sensitive to line voltage because the filiments in the oscillator and first mixer change the frequency when they vary. I run mine on a Sola transformer to avoid this problem.

I think at least some of the problems the SP-600 has come from its being a continuation of the older Super-Pro line with some attempt to make it look similar. So, the band switch and tuning controls and the two dials _look_ like the old Super-Pro layout with a main tuning control and a bandspread control. I think Hammarlund also ran into difficulties in trying to get the entire receiver, including power supply, onto one chassis. This may be the reason they abandoned the push-pull audio which was a feature of the older SP series. While communications receivers are not used for Hi-Fi the lower distortion of a good audio amp reduce the effect of noise by eliminating all the distortion products resulting from it in a poor amplifier. The amp in the Super-Pro and most other communications receivers leaves a lot to be desired.

I suspect the SX-73 may have proved too expensive for Hallicrafters to make profitably but have no definite information. They seem to be quite rare, I've only ever seen one in the flesh.

BTW, after many years experience with SP-600's I've come to the conclusion that a great many of them are "working" but are still broken in some ways. The performance of the RX is very good and complaints like stiff tuning, poor frequency calibration, poor RF tracking, etc., come from "broken" components.

> Truth told, you're about right..... The SP-600 does have virtually the

same features. I'd forgotten that the '600 does have a filter phasing control. I guess the only feature might be the antenna tune control but one could argue the efficacy of that! The only other thing might be the physical compression/calibration of the amateur bands. The Hallicrafters has a bit more spread than the SP-600 on most ham bands. Beyond that, your comment is appropriate.

The other comment might be that re-capping an early SP-600 can be laborious, especially when replacing the caps on the turret modules and inside the RF side channel. Not difficult, just laborious. Later models don't have that issue, of course.

Hello Brothers of the Glow,

I am restoring some Hallicrafters dials that have experienced damage to the silkscreening of the numerals and the slide-rule line. I've successfully re-lined the dials and added the tick marks but I am needing rub on letters that are approximately 0.046-inch (3/64-inch) tall. The smallest black rub on lettering I have been able to find is 2.5 mm high which is too large to match the other numerals on the dial.

Any recommendations will be greatly appreciated.

WPE9GHF

There is a list on one of the Hammarlund sites with a list of military contracts for the R-274 on it. I don't know when the earliest order for the Hammarlund version was put made.

About the crystal filter: Hammarlund owned the patent for the version of the filter used on its receivers and, later, by Collins and others. The original Lamb filter had problems with broadening it out, it tended to shift center frequency, and the notch was not symmetrical. Hammarlund's version allowed broadening out enough to use on phone and had pretty constant gain. Also, the use of a double phasing capacitor allowed keeping the peak centered when varying the notch frequency. In general T-notch filters work better but the crystal was the best available at the time.

The Hallicrafters S-73 looks well worked out. I think they simplified the turret contact arrangement quite a bit but I don't know how well it works in practice.

Hammarlund made the mistake of taking Sprague at their word about _Black Beauty_ caps. These were _supposed_ to be deluxe, low leakage caps with a wide temperature tollerance. The dielectric as a combination of paper impregnated with plastic. They _should_ have been very long lived and of good performance. Unfortunately, something went badly wrong. My own suspicion is that the casing material had some serious problem. Many of these caps are found split and not just at the mold seams. The caps inside are distorted in shape. Of course, I don't know that they were wound round originally but the bad ones are flattened in various ways, I suspect distorted by the shrinkage of the case. Sprague also made a similar cap with radial leads called an "Orange Drop". These were dipped in epoxy rather than being molded in whatever was used for the BB caps. I've never heard that these were particularly trouble prone. BB caps were used in some very deluxe equipment such as instruments made by General Radio and Hewlett-Packard. I first heard that they were bad guys when I was a teen ager so the problems must have shown up pretty quickly. I don't think all BBs are bad becuause Sprague continued to advertise them after the time the military issued the MWO for chaning out all of them in the SP-600. There are probably people who know first hand what happened.

There sure are a lot of questions about old equipment which were probably answered in the manufacturing data but I doubt if much, if any, of that exists because most businesses see keeping historical records as unprofitable and return on investment is what makes the world go 'round.

I have had excellent results using my CAD program to generate the artwork
and then printing to water slip decal paper. The substrate of the resultant
decal is very thin and thus edges virtually unnoticeable. Small Parts also
sells a liquid that can be applied to make the substrate disappear entirely
(I have not tried this)..

Thanks, reading those discussions and other references, it was possible to determine that single-ended audio transformers must have a gap in the magnetic path, this fact making power transformers generally unsuitable for that application.

I *HIGHLY* recommend you check out Pulsar
http://www.pulsarprofx.com/

I've personally used this technique to recreate silkscreen labels. You cannot tell this from the real silkscreen process. There is about a $50-$100 initial outlay. If you can find a used laminator, you can save most of that cost. The technique takes a little practice but it is well worth it if you treasure your old radios. There is a short video on the site that demonstrates the technique. This guy has come up with a process where you laser print (ink jet will not work) onto a special paper. Then the text/image is transferred to a clear mylar 'carrier'. Following that the image is finally transferred to wherever it is meant to go. You can do ALL colors, even WHITE. Anyway, give it a try.
Jim

The same problem with the DC flow in the transformer exists when a power transformer is used with a halfwave rectifier.
Typically the transformer rating is degraded by 60% when be using with halfwave rectication due to the DC current flowing in the secondary.

```
Many folks have used filament transformers
as audio outputs replacements with good results.
The transformer rating is decreased by the
standing DC current,  but it will
still handle a good amount of audio before
saturation on peaks occurs.

Peter

I've got an HQ-180 that needs some work so I think I will give it a
try.

There seems to be a problem with their email as it does not work!

Robert:

I am the curator at Battleship Cove in Fall River, MA and am very
involved in the restoration of our radio rooms.

Up until recently, we have visited WWII vessels in search of parts for
ours, and I have seen several old radio rooms. The TCP was present on
the HASKELL class attack transports LAUDERDALE and GAGE. I have always
been curious myself as to how they were used, for the radio rooms in
both ships covered the same frequencies with other equipment.

Hope this helps a little bit.

Chris

Objective is a HBR receiver that will serve as a 160 meter tunable IF for the HF ham bands. I need the tuning assembly (tuning cap and RF coils, and the 700 kc IF transformers.) Cabinet condition, lack of tubes, NOT a consideration!!

Anyone ever use one in a HB transmitter? I have a 4/104 that I'd like to use in a homebrew CW transmitter, and I'd like some feedback from any OTs who may have used these in the past... Are they stable enough for CW work; any hints or kinks?

Project I am envisioning is a poor ham's version of the Johnson Navigator that is now unaffordable on ePay :)

Pete

Did Bud put out any technical data or suggested applications for their products? I'm thinking about using a BTCL bandswitched PA tank circuit assembly, but I'd like to see how Bud intended it to be used. Did QST ever feature HB TXs using Bud assemblies. Or, Geloso assemblies?

I had both the vfo and the Geloso transmitter (part of the Geloso pair station). Yes, the VFO is as stable as the Navigator. As I recall the vfo was the same as the version you have. You might ask Meir, WF2U, who has several of the units on the air. He is usually on boatanchors@theporch.com reflector.

Hi All,

I picked up what appears to be an early 1960's Zenith Inter Oceanic Solid-State model Royal 91 set. Is this a poor mans Trans Oceanic? What should I expect from it in terms of performance? It appears to be a no-frills set, not even a pilot light in this beast. It runs on 8 D cells, almost an anchor. It appears to be OK on AM, but I haven't run it on SW from fabulous NW N.J yet.

I would imagine that getting the original Zenith 12v power supply is out of the question, no?

Has anyone had any experience with one of these yet?

rgds,

Mark S.

I have two of them. They are to transistor Trans-Oceanics what the L507 "meridian" model was to tube Trans-Oceanics-essentially the same circuitry but minus the individual spread bands that made the TO one of the most famous and imitated shortwave radios of its era.

They are good radios-vitually equal to the transocenic in performance
but harder to tune in stations because there are no spread bands.

Two notable issues with them: The band selector can feel cheezy and
sluggish, but nothing could further from the truth. It is hooked to a
quality metal-geared apparatus which often needs adjustment to eliminate
mechanical play.

The tuning knob is brittle and seem to get hammered and broken quite often.

Other than that, the quality of these radios is quite good.

-Scott

```

The UK Army used to have a radio interception vehicle known as a Vampire,
based on the Forward Control Landrover.

The Vampire vehicles were withdrawn some years back but I can't find any
info. on what replaced them.

Anyone have any pointers, please?

I have not, although I have used the 6JH8 for product detector designs
before and they are just fabulous.  I think they are certainly the equal
of the 7360.

There are a bunch of other sheet-beam tube designs out there as well,
```

also intended for color TV chroma demodulators like the 6JH8. They
are all fairly similar.

I have a copy of a 1942 edition of the ARRL Handbook which is thinner
than usual and headed "Special Defense Edition". The content is strong
on theory.

Yes, because I stole the design from RCA.  How balanced it really was,
considering my handmade transformers and sloppy wiring, though, is another
question.

My WA7 call has been with me for over 30 years but the lure of a prestigious 1x3 or 1x2 calls me. I've noticed that the WA and WB calls are starting to sound like old timers because all the new guys seem to be sprouting 1x3s and 1x2s. Have we reached Critical Mass on callsigns and now what WAS new is OLD and what used to be old is now NEW?

What do you guys think? Is working a 1x2 or 1x3 a turnoff as opposed to a WA or WB call?

73, Rich

I think whatever novelty there was to having a vanity callsign was lost with the advent of no-code licensing, and with the FCC no longer licensing by calk sign districts.

Personally, and I've thought about a vanity call at one time, I'm more inclined to keep my original 1960's vintage 1x3 call sign at this juncture. My personal opinion..

Pete

I have a vanity call sign because its my original call.
I was a lapsed ham for many years and when I got licensed
again I put in for my original call which had never been
re-issued. Its a bit clumsy but I did well enough with it in
the sixty's when I first got it. I was also able to get call
plates for it again the originals having been destroyed on a

car that got totaled :-(

My call is vanity because I was able to get my initials. Which served
a double purpose
for getting plates for the car.

I don't look at any callsign a turnoff. It's a contact with a fellow
ham and why
they chose their call is a good point of discussion to know them
better.

On the FCC lifting the Call sign restriction by location I still think
was the
least thought out idea ever. I hated it, it took something really
special away.

So be it 1x2, 1x3, or 2x3. You will all be friends at heart.
We share a great and glorious hobby.

Me too.  I had to give up my 6th district call when I moved to the 7th
district.  Then the FCC decided to do away with the requirement to
have a district call when you move.  They also decided to do away with
getting your original call back when you return to the district you
started in.  It really grates on me to have to pay the FCC to have my
original call back that they made me give up in the first place.  At
least I have it.

As has been said, there's no reason to do it if one is looking for a
call that connotes longevity... none whatsoever. Although I've had my
call since 1959, I thought about it when my initials became available as
a "W" callsign. Thought about it for a while and rejected it. Besides,
I still have a couple of hundred or so new QSLs with my current call-sign.

I have a Geloso G.222 transmitter that utilizes the model 4.104 VFO

The VFO stability is good enough for CW up to 20 meters, but on 10 meters it is so and so. Anyway you may try it yourself by just powering the VFO and hearing the signal on an external receiver.

Eventually Geloso produced the 4.105 VFO which adopts a conversion scheme with a crystal for each band

Hard to give you an useful advice. I would just like to let you know that, while today the majority of US hams seem to have calls of the 1x2 or 2x1 type, looking at my logbook of the 60ies and 70ies the 1x2 calls were quite an exception at that time, the vaste majority being 2x3 calls.

Tony I0JX of Rome, Italy

US call AB6VZ (1993), eventually switched (1996) to the K0JX vanity call

I'm looking for information on the CMS "suitcase" radio.

militaryradio.com had a few tidbits on it, but I'll be looking for info on its use, possible manuals, etc.

I'm helping a friend who has had it sleeping in his basement since 1965, and wants to get it ready for sale...

Tubes, coils, camouflaged key (black plastic cover to shield the sparks) and cables, 2 unused coils of antenna wire & insulators. Even a light-bulb on a coil for tuning! All are there, and it seems to be in good condition for its age.

Only things missing are the separate hand generator and a handle for the suitcase.

I'll be photographing it and helping to spruce it up for my friend.

Thanks for your help!

Jerry, W9NPI

It isn't a boatanchor, it neither has tubes nor the weight, and barely has the vintage.

The only way it comes close to being a "boatanchor" was that Drake ad from way back where they wrote about a customer who bought one and stuck it on the carrier of his motorcycle, and then a few blocks later realized it had fallen off and was being dragged behind. He never noticed, he was holding the microphone and talking away, and it was the mic cord that was dragging the rig along.

Since it was a testimonial, I guess but can't remember that the rig survived the dragging.

Due to recovery from surgery, I missed responding to an interesting topic or thread a few weeks back lamenting the high prices for used equipment; my experience on here and other sites is that the person who asks for less than 50% of the new value for a piece of used equipment is a rare person. Even still I have purchased items with scratches and flaws that never were mentioned.

It comes down to ones value system, but please, list every noticeable fault and then set the price to where the item is a bargin for someone- just like it is.

Anyone with money who is older than 60 will forever raise my suspicion when selling or repairing something for me.

Excuse my cynicism, but it is a bit ironic that a person in their sunset years who is closer to leaving every earthly possession behind would have an inordinate affectionfor money and the tightest squeeze on things.

It must be the pride of life stage, but the bubba with little more that a pair of Kmart shoes and a push mower to his name is the one who tends to be the most generous among, not those with worth!

kicked one too many times when I was down on money in SC

No one is required to purchase any boat anchor. The seller is free to set any price he or she chooses. Sometimes, sellers think their item they wish to sell is worth more than the buyers do - in which case the item remains unsold.

Whether a seller is 90 or 20, the obligation is the same - describe the equipment accurately.

I often purchase boatanchors at much more than the purchase price, with scratches and other defects. As long as I know what I am getting, I am happy. Once it is mine, I can modify it, hoard it, deface it or sell it for a profit - because it is mine.

Does anybody know the value of this rig. It is a 75 Watt AM
Transmitter-Receiver. It used Dynamotors is xtal controlled and was
built for the Navy to operate on 2 to 3 mhz. Is this something someone
might use or is it for a Museum? The only thing I could find out is
that it is the same as a RMCA ET-8012-HF. It is built like a tank, and
very heavy.  If you have any interesting info on it please email me
directly at: robtram@sbcglobal.net as I don't often read all the posts
hear. Thanks, Robert

Mr. Fred ,you are certainly entitled to an opinion, This opinion as
stated only shows stupidity, being honest has nothing to due with age
or position in life.People that work hard ,manage well,and make good
decisions always seem to do better in this country..Ever notice that?

Harold,
Get your walker, and please fetch those bifocals.

I never equated age with honesty or dishonesty- only with becoming
greedy and self-centered.

Thank you all for your comments. Some were helpful.
Richard and Pete, I appreciate your sincere thoughtful expression of the concerns and consideration that accompany this decision.

As for the stupid comments such as that which he takes offense at my use of the word "turnoff" and then I am told "send in my license" (obviously this character sees himself as the 'Goodwill Ambassador of Ham Radio'), I even appreciate those

I'm leaning toward keeping the old WA7 and letting the 1x2s and 1x3s identify those that an original call doesn't fit for whatever reason.

73 Rich

Fred, you still have it wrong. Were your supposed observations correct, we'd have a hell of a time drumming up scholarships for deserving youngsters, private grants to needy organizations, volunteer efforts and the like. You just might have
something however, if you made the comparison to politicians and academics instead of age. Try harder not to assess everyone else with a comparison to your personal value set. How's your effort going on the Cubic?

>

But we're not talking about used equipment here, we're talking about old equipment.

As has been said before, go back about forty years, and you could get all kinds of boatanchors for next to nothing. Everyone wanted SSB, everyone wanted solid state, so the tube equipment, much of which was AM, was virtually tossed away. I got all kinds of stuff in the early seventies, played with it and then traded it off. Few were collecting it, and those that were didn't have to pay much for a lot of that. I really wish I'd kept that PMR-8 receiver, but at the time, something else interested me so I traded it off.

That was the period when the boatanchors were still useful for the beginner, as cheap equipment. And the cost was way lower than fifty percent of the original price.

But forty years later, attrition has meant less and less of that gear still exists. And forty years later, the people who tossed it aside back then are regretting it, or wanting that equipment they lusted after as a kid but which was too expensive (like that Tapetone VHF receiver that may or may not have existed as an actual product). They aren't looking for equipment to get on

the air, they are looking for equipment that reflects an era long
gone, be it amateur radio or their own lives. They are collecting.
Some will have extensive collections, others will have only a few
pieces.

So that keeps the price up. Limited quantity and relatively high
demand.

If people are looking for equipment to use on a regular basis,
they are looking in the wrong place, they need to find the buy
and sell newsgroup.

This is no different from anything else. I can still get copies
of Alvin Toffler's "Future Shock" for fifty cents. But plenty of
books from the same era that never sold so well in the first place
now carry a premium price, far higher than the original cover price,
because people want them and they have to fight over a relative
few copies.

Here are a few items for sale. Prices do not include. I will ship
overseas.

Heathkit SB-200 80-10 Meter Linear Amplifier & Manual...$425 plus shipping
This is a 1 KW 8-10 meter linear amplifier that runs off of 110 VAC or

220 VAC. This amp is unmodified with the exception of a BNC jack replacing the RCA connector (good mod!)and is in very nice shape with no extra holes and all of the correct knobs. It has a few paint chips and a previous owner put some kind of ID number on the back of the unit. Nothing has been arced or burned and the ham who built this did a really excellent job on the soldering/wiring. Puts out around 500 - 600 watts with 100 watts drive on 110 volts. I have used this with my Yaesu FT-1000MP transceiver. Includes a photocopy of the manual.
http://members.cox.net/radiostuff9/sb2000.JPG
http://members.cox.net/radiostuff9/sb20004.JPG

Swan 500C SS-16B Special Transceiver and 117XC Power Supply....$300 plus shipping
This unit works quite well. I measured around 200 watts CW output on my Bird meter with a dummy load. The receiver sounds good. Cosmetically the unit looks good however it does have some scuffs and scratches to the outer case. I have been using this radio for the past 18 months and have made hundreds of contacts with it on 75, 40 and 20 meter phone. Most recent was on field day last month where it made over 100 QSO's operating field day from my shack.
http://members.cox.net/radiostuff9/swan500ss16b.JPG
http://members.cox.net/radiostuff9/swan500ss16b3.JPG

Heathkit SA-2060 Legal Limit Antenna Tuner with Manual...$350 plus shipping
This is a legal limit tuner that cover all frequencies between 160 and 10 meters. It will match balanced and unbalanced lines , single wire and ladder lines. It has a dual watt meter that has a 200 watt and a 2000 watt scale so you can read forward and reflected average power. This tuner is in excellent condition with a few light scratches to the outer case. The inside is clean with no evidence of abuse or arcing. This is a great tuner rated at 5/5 with 31 reviews in the equipment reviews section on the e-ham web site.
http://members.cox.net/radiostuff9/heathsa2060.JPG
http://members.cox.net/radiostuff9/heathsa20602.JPG

http://members.cox.net/radiostuff9/heathsa20606.JPG
http://members.cox.net/radiostuff9/heathsa20607.JPG

Collins Radio SM-2 Dynamic Microphone....$275 plus shipping
This is a clean working unit with a few very minor scratches. It is wired for a Collins KWM-2 or a 32S transmitter. I used this with my KWM-2A and also with a Swan 500C with an adaptor for the plug. Worked well and received great audio reports.
http://members.cox.net/radiostuff9/sm2collins.JPG
http://members.cox.net/radiostuff9/sm2collins2.JPG
http://members.cox.net/radiostuff9/sm2collins4.JPG
http://members.cox.net/radiostuff9/sm2collins3.JPG

Westclox WT8AMP Canadian Military Telegraph Key..........$50 plus shipping (I have several of these)
The key appears to be new old stock and in excellent condition. I believe these were used by the Canadian Military in W.W.II.

http://members.cox.net/radiostuff9/mil_key.JPG
http://members.cox.net/radiostuff9/mil_key2.JPG

USN AN/URM-25F RF Signal Generator - Original Manual......$25 shipped
Original manual in excellent condition.
http://members.cox.net/radiostuff9/urm25fmanual.JPG

Hallicrafters SX-43 Receiver with Manual....$130 plus shipping
The receiver works but would benefit from a restoration. I listened to signals on the AM broadcast band, WWV at 5, 10 and 15 MHz as well as signals on several short wave bands. I did not hear signals on the higher bands or on the FM band so I would assume it needs help. The s-meter works, the BFO and crystal filter work. Cosmetically, it has lots of scuffs and scratches as can be seen in the photos. It has all of the correct knobs. It does not have any dings, dents or extra holes. This is a a heavy receiver. Includes a photocopy of the manual.
http://members.cox.net/radiodx5/sx43.JPG
http://members.cox.net/radiodx5/sx432.JPG
http://members.cox.net/radiodx5/sx433.JPG
http://members.cox.net/radiodx5/sx435.JPG

Hewlett Packard HP 711A High Voltage Bench Supply...$125 plus shipping
This is a regulated high voltage power supply with an output of 0-500 volts dc with a maximum current of 100 mA. Unregulated ac output is 6.3 volts at 6 amps maximum and 12.6 volts center tap at 3 amps maximum. The supply has two meters. The current meter measures 0-100 mA and the volt meter measures 0-500 volts or 0-50 volts with the push button. This includes a photocopy of the HP 711A manual.
http://members.cox.net/radiostuff9/hp711a.JPG
http://members.cox.net/radiostuff9/hp711a3.JPG

Advance Electric Dow-Key Clone Coaxial Relay....$25 plus shipping
Antenna changeover relay made by Advance Electric which looks identical if not more ruggedly built than a Dow-Key relay. Possibly this company built the relays for Dow-Key. This is a 24 VDC unit with SO-239 connectors. Tested and is in very good condition.
http://members.cox.net/radiostuff9/advance_relay.JPG
http://members.cox.net/radiostuff9/advance_relay2.JPG

TenTec Electro-Voice 729 Microphone.....$25 plus shipping
EV Electrovoice 729 High Impedance Microphone with stand. This mike has a TenTec logo so it probably sold by TenTec for use with their ham radio equipment. Cosmetically the mike looks good but is missing some paint in places. I hooked the mike up to my Bogen amp and it is working. Sounded very good with nice strong audio when listening to it. It is currently wired with a 2 pin microphone connector most likely wired for use with a Johnson Ranger or a Johnson Valiant transmitter.

Acoustic Research Turntable - 1960's and AR Brochure...$100 plus shipping
This is a one speed (33 1/3) turntable mounted on an oiled walnut base. This one has a Shure cartridge installed. The specs are shown in the photo below. I hooked this up to my Fisher 800B and Cerwin Vega HED

speakers and listened to a few records. The turntable is in good operating condition. The dust cover is included but it is cracked. I will also include an original 1960's AR catalog which does have this turntable in it.
http://members.cox.net/radiodx5/ar_turntable.JPG

73 and thanks for looking.

A couple of times at the TRW swap meet I've seen a call on a call plate which belonged to a very dear friend who is now deceased. Very strange feeling. I'm tempted to call or write this person and find out if he knew my friend.

You forget that a lot of us 1x3 holders really are OTs; I view holders
of 2x3 calls as newcomers (except for 2s and 6s) :-)

I've never been turned on or off by the call of a US contact, especially
since you no longer have a clue where the other station is located.

I've held 3 calls in my life; my original K3OCN from 1961, W2HIR from
when I lived in New Jersey in 1973 and my current W0RSB from 1977. All
calls were obtained by the luck of the draw.

I have for sale a nice Alliance HD-73 Rotator with Control Unit and Original Manual. This Rotator and Control look very good, showing little wear or use. They both work, but the rotator seems a little slow to me. It has been stored for years and may need a little lubrication. I am asking $175 plus shipping from 79602. Thanks, Charlie Hugg, K5MBX

I thought a lot about vanity calls. At first I wanted to keep my first call, KC4YOY since I knew it had never belonged to anyone but me, then I thought about dropping the KC and getting W4YOY. Then when I got active on HF I found that the long call and the YOY was hard to get across to most DX stations.
When I first go on-line and discovered QRZ and started looking up call signs, I thought wouldn't it be great to have W4RON

since my name is Ron. According to QRZ W4RON was to expire in 2005, so about once a year I'd check on it. 2005 came and went and it didn't get renewed. A call has to be inactive for 2 years so in October of 2007 it became available for reassignment. So after watching it for 12 years I was lucky enough to get W4RON. It was held by the previous owner since
1950 and he was the only one until I got it.
Here's my new QSL card I made for it.
http://radioheaven.homestead.com/W4RON-QSL.html

73, Ron W4RON

Hello to all .. I am wondering if anyone in this group has or knows of someone besides me that has one of these scarce (made 1977 & 1978 only?) SS 10 thru 80 transceivers. I would like to pay for a copy of each loose schematic sheets. My friend did find the manual, but it refers to at least 3 schematic sheets. Thanks for the read and your consideration. Larry

Refurbished Hammarlund SP200 Late Pre war receiver. Cleaned up in and out lots of buffing! Replaced caps where needed esp paper caps. Re-Tubbed, Face Plate repainted and re lettered. Org knobs. Comes with a power supply with new rectifier and ballast tubes, also thats been gone through and works FB. The rig performs nice 3-16 K wide for HI FI AM Receiving. This is rig is rated right up next to the R390A! One of the best of the best. $500.00 Plus shipping Email for detailed pics.

Hi All;
Am getting to the point that I cannot enjoy all these BA's
So I have decided to sell the above receiver.
It covers from about 27mcs to 144mcs in 3 ranges, built around WWII,
in the original cabinet.
receives both AM & FM with BFO for CW & SSB.
Has multipostion audio control, like Bass boost, HiFi, etc

Built in the same scale & Quality as the SX-28 & just as heavy, around
70lbs.
It is in Excellent condition, all original knobs, cabinet, etc &
Playing, might need a tube or so for max sensitivity.
Filter cap has been bridged with a newer multi-section metal can type
cap.
Internal, inline AC fuse installed.
Needs an easily made aluminum cover for over the tuning cap section, I
just never got to it.
Great for 10 meter AM or HI-FI FM band, mucho audio from dual 6V6's.
Pick-up only in SW Florida for $200 or BO.
Pictures coming soon to a theater near you

Tnx & 73........
Rich WA2RQY/4

Not exactly a boatanchor but still allready old.
I am looking for backcopies of 73 magazine to complete my collection.
Wanted are 1998, 1999, 2000, 2001, 2002, and 2003.
I will pay a reasonable price and postage to an address in Wisconsin or to
an address in Canada.
      73 and thanks de Sieb, VE3JUA.

I recently acquired an HRO-50T1. After a re-cap job, tubes, cleaning, and a light alignment, it now works just fine. I have a question about lubricating the HRO dial mechanism. It seems to be dragging and mildly squeeks. Its not binding; it just sounds dry or something. Also, how the heck does one change the dial lights? It appears that a complete removal of the cabinet/front panel is required. Can anyone confirm this or know the real secret? Finally, I have a 50-1 book from one of the manual providers and it shown use of a 6SN7 in the audio chain. Mine has a 6SJ7 instead. Is my 50T1 receiver a later or earlier version of the 50-1 series?
Thanks much.

Jeep/K3HVG

On Jul 26, 3:46 am, k3hvg <je...@comcast.net> wrote:

> I recently acquired an HRO-50T1. After a re-cap job, tubes, cleaning, and a light alignment, it now works just fine. I have a question about lubricating the HRO dial mechanism. It seems to be dragging and mildly squeeks. Its not binding; it just sounds dry or something. Also, how the heck does one change the dial lights? It appears that a complete removal of the cabinet/front panel is required. Can anyone confirm this or know the real secret? Finally, I have a 50-1 book from one of the manual providers and it shown use of a 6SN7 in the audio chain. Mine has a 6SJ7 instead. Is my 50T1 receiver a later or earlier version of the 50-1 series?

====================

The "T" in the model number indicates a table cabinet (rather than a rack mount version). So your 50T1 is in fact a 50-1 and is the later version with three IF stages. One section of the 6SN7 is used as a phase-inverter for the P-P 6V6 output tubes, the other section is used as a S-meter amplifier in both the late and early versions. The first audio amp is a 6SJ7 in both versions. Hope this helps. --Ed

Ed,  Thanks for the clarification.  One likes to know the chronology of
models these radios.

Howdy all...

Does anyone have a specification sheet or info on the International
Rectifier Z-1100 zener diode? OR do you know of an equivalent that would
short high voltages while present high resistance to to low voltages. I'm
needing two of them for a receiver antenna muting circuit.

Thanks.

W9STB

How high a voltage do you want to shunt?
What frequencies are you operating at?
How much current do you need to dump?

```
Those three things are all you need to specify a zener.

I have for sale a nice Alliance HD-73 Rotator with Control Unit and Original Manual. This Rotator and Control look very good, showing little wear or use. They both work, but the rotator seems a little slow to me. It has been stored for years and may need a little lubrication. I am asking $215 plus shipping from 79602. Thanks, Charlie Hugg, K5MBX

There are a great demand of 'world of warcraft gold'
(http://www.wowgold1000.com/), on our website, however *cheap world of
warcraft gold* sells fast. It looks as if it is out of stock right now.
So we can say our customers at the first time come to our website
http://www.wowgold1000.com to choose their 'world of warcraft gold'
(http://www.wowgold1000.com/world-of-warcraft-gold.html)with their
needs. The reasons why over 200,000 customers pick our services are as
follows.- We do free delivery service on 'wow gold'
(http://www.wowgold1000.com/) 24/7 and have online friendly support
24/7 as well.- Each of our customers with sincerity and enjoy doing
so.- With the fastest delivery and reliable service, we never lie to
every customer about issues we may be having.- We reward our customers
with our unique and wonderful gifts.- Members enjoy discounts on the
'cheap wow gold' (http://www.wowgold1000.com/)prices.- We are by far
the most secure company out there as we guarantee all our customers
against fraud.'Buy wow gold' (http://www.wowgold1000.com) now!

For Sale: Nice Restored Collins S-Line: 75S-1 and 32S-1.
This early Collins S-Line is in exceptionally nice original cosmetic
condition and it works great. These units are lightly used and they have
been recently restored by R.L. Howard. Price is $950. Pictures are
available upon request. Thanks, Charlie Hugg, K5MBX, CCA#307

If I recall right, the 1944 issue had some power line carrier transmission
equipment schematics.  $10 is a bargain for some interesting history.

I don't know about the edition, but you're right, there was apparently
material to compensate for the lack of amateur radio during the
war years.  I seem to recall they were also reoriented a bit, to
be a more general training book for radio men in general, but I
can't remember where I read that.

I can't remember the publishing history, I'd suspect unless they
could sell the handbook as a training aid for the radio men
in the military, they likely didn't publish a handbook every year.

I think QST kept publishing, unlike during WWI, and that too would
have been a source of those ground communication type things.

I have a few QSTs from about 1947, before all the bands had come
back, so it's an interesting transition period.  The war is over,
some privileges restored, but not all, meanwhile everyone all excited
about the bands about to be restored, and lots of articles about
surplus.

I need a headset for the Instructograpgh I am restoring. Something
along
the lines of what you see old telegraphers using. I remember seeing
some
that had two pins on the end instead of a plug.
Anyone have something like that ?

Tnx, Dick, W1KSZ

The phones suppled with the Instructograph were common magnetic phones as made by perhaps a dozen manufacturers. Phones of this sort were made and sold up to perhaps the 1970s. They were never used for wire telegraph work only for radio telegraphy. I seem them very rarely at the local ham swap meet but eBay would do better. You will also need a key. Most of the keys supplied by Instructograph appear to have been made by Signal Electric Co., I had one which disappeared in some move. These keys do not have circuit closers on them. The Instructograph appears to be identical to an earlier practice machine called the Teleplex. They use wind-up phonograph motors to drive them. I have no idea of what sort of oscillator Instructograph supplied, they don't appear in the ads but undoubtedly they had something available, maybe even just a buzzer.

Late magnetic phones are nearly identical to the early ones so one must be careful not to pay collectors' item prices for something that is just old.

Some brand names are Trimm, Brandes and Cannon-Ball (same company), Utah, Western Electric, Baldwin (valuable), and others. Check eBay, I rarely see old phones of any type at the local ham swap meets.

Richard, I have an old pair of cans by C.F.Cannon. They have a cotton covered cord, and it ends in a PL55 type plug that is made by Brach and labelled shockproof. I can just see the ends ot a pair of pins on the cord, inserted inside the plug.

These were a birthday present a good many years back from a fellow ham, but I have never had a use for them and they have remained in a desk drawer since I received them. (They are still functional.) They have been modified very slightly by having the word "zippy" engraved on the metal back, just above the C.F. Cannon "Cannonball" logo to make a set of phonetics I have occasionally used in years past. I expect to be moving to smaller quarters in the next few years, and I think your use of them would be more fitting than anything I can use them for. Yours for the postage if they would be of use.

Regards
W4ZCB

The K9YA Telegraph is a FREE, monthly, general interest amateur radio publication read by ham radio operators in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

Hello,

I'm plan to start the restoration of a Navy RBO-2 receiver Scott SLR-H) shortly. The receiver seems to be complete except for the dial bezel and pointer. Also, the metal Navy ID plate is missing. Do you have any idea where I could locate these missing items? If so, please let me know.

The front panel of my set has a black finish and the cabinet is painted green. Some of the photographs that I have looked at on the Internet show the RBO-2 with a black crinkle finish. I recall someone telling me years ago that the Navy receiver was gray. Do you know what the original color and texture of the front panel was? Also what was the color of the cabinet?

Thanks for your assistance, Tom

Test Preparation Software

Pass your US FCC ham radio license test with ease. Our test preparation software
serves as a training aid to help amateurs and prospective amateurs pass the VEC's administered test. When you can consistently pass the test given by our test preparation software, you will almost certainly pass an actual test.

Our ham radio license test preparation software uses the latest officially released VEC's approved question pools. The program breaks the test into different sub-element. Integrated into the software are illustrations and Part 97 rules pertaining to the current question. The program tracks the progress of the tests taken. Once you have mastered each sub-element you are ready for the official test.

Visit our web site at http://www.hamradiolicense.net for more information.

I am in the process of adjusting a restored BC-312. Reading the book, I could not determine whether the oscillator must oscillate at +470 kHz or - 470kHz with respect to the receive frequency.

The oscillator adjustment range is wide enough that I can set it at either positions, so I need to know which of the two is correct (so as to have the dial scale showing the real receive frequency as close as possible).

Also, I would need to know whether it works the same on all bands.

Thanks in advance for your help.

Thanks Ed.

In the meantime a local guy had told me that for bands A, B and C the oscillator
should be set higher than the operating frequency, whilst for bands D, E and F
lower.

What is your degree of confidence on the issue?

This receiver is covered in the military manual TM
11-850 which can be downloaded from the BAMA site. It
appears to be available from some other free sites, a Google
serach found a lot of hits.

As you will note re-reading my message more carefully, I have the book, but I
could not find the required information in there. I will search it again and see
whether it is written somewhere.

Ed,

I re-read the book carefully, and I found the explanation in the adjustment section, not in the theory of operation section as I was expecting.

At page 126 it clearly states that the oscillator is on the low side for the three higher frequency bands and on the high side for the three lower frequency bands.

Sorry for the useless noise, I should have read the book more carefully.

Thank you for your availability anyway.

================
Forget that!! I just checked my notes and I got my BC-312 and BC-314
confused. Your friend is correct. It is the LO higher on bands A, B,
and C and lower on the three higher bands. Sorry for the confusion. --
Ed

For Sale ......Hallicrafters SX-115......
A triple conversion receiver in good shape and working condition
It has been re-aligned by an expert ham with all modern test equipment..
Pictures are available if required.
 I would prefer pick-up with all heavy equipment to save the equipment from
any damage by transporting by any postal service.
Two-way delivery/pick-up   (Yours and mine)   can be arranged by further
communication.
Asking price is $ 950.00   USD

I also have a Hallicrafters R46-B Speaker in great condition Asking $
100.00 USD

Hallicrafters R-48 Speaker in good condition Asking
$ 80.00 USD

Hallicrafters R-47 Speaker in good condition Asking
S 60.00 USD

If you can pass this e-mail on to all interested hams in your Hallicrafters group would be greatly appreciated..

Thank you,
73

Both mine had Black wrinkle painted cabinets.
I don't have them any longer:-(

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday July 20th 2008
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if you're lucky enough to have a copy of our ad) and sellers spaces are $20 for the first and $15 for each additional at the gate.

The flea will be held on Albany between Mass Ave and Main streets in Cambridge; right in the Kendall Square area from 9AM to 2PM, with sellers set-up time starting at 7AM.

*** Attention Sellers ***

Prepaid vendors.. Season Pass or monthly, will be admitted FIRST. Separate lines will form prior to gate opening for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered well illuminated tailgate area is available for all sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776 (M-F 9-5)

********** $1 buyers discount with hard copy of this notice ************

<FF>

Mail the coupon below by the 5th to be a Prepaid Vendor.

Website:http://www.mobicoverter.com/

3GP/mobile/iPod/PSP Converter convert your VCD, DVD and AVI(DivX, MS MPEG4, uncompressed, etc), MPEG-1, MPEG-2 (PAL, NTSC), MOV, WMV, FLV and MP4 video files to 3GP, 3GP2 and MP4 files without knowing any technical jargon(such as Bitrate, Sample Rate, Frame Rate, etc) at all! So then you can transfer to your Cell phone, PSP and iPod, and enjoy them Anytime, Everywhere!

And we have provided dozens of codec profiles for most popular cell phone, such as Sony Ericsson, Nokia, Motorola, Samsung, LG, Simense, Pansonic, Sanyo, NEC and so on. What you have to do is simply launch the software, and pick up your model!

are you looking for suppliers of high quality shisha tobacco interested in exporting to Poland, to feed the developing popularity of shisha smoking in the country. So far only low quality producers are present on the market, and only small batches of high quality tobacco is being brought to the country by individuals who travel abroad or order from internet stores in other countries for personal use, yet the demand for higher quality tobacco is very high on all community forums, as well as among hookah bar owners.

Looking for two of these tear-drop knobs, and the face plates also.

Thanks,

Bob W1CNY

Here's an addendum to that: Craig at Kiwa Electronics advises me that the later G5 models have factory-installed ESD-arrester diodes installed across the built-in, telescoping-whip antenna, eliminating a big concern of mine about the unit. I had him order one for me with instructions to do the ESD mod and the audio mod. He only did the audio mod, and advised me via E-mail of this change. Looking forward to receiving the unit and seeing (hearing) for myself what all the fuss is about.

Jim, K7JEB

I have Sylvania Electric tube tester. Has worked for many years, but today known good tube test flat zero. Filaments do light. I have no model number, it is a green panel, with roll chart.

Anybody know what might go wrong. I looked inside and see one tube, a 1EL7 I think it was. Other wise looks good, with no bad smells.

Thanks, Bill

Is there a fuse? Is it good?

Check the Meter Movement with a very low voltage and lots of resistance.

Set the tester up for a few tubes, one at a time, and measure the voltages at the pins. Trace back to source of missing voltages. Wiggle the pots for affect.

A tube manual will suggest what voltage to expect.

There are probably at least two DC power supplies in the tester. Check them for input and output voltages. Depending on the vintage of the tester you may have selenium rectifiers that have a too high internal resistance. Don' forget to test the capacitors for shorts.

And don't forget.........The internal toob might be shot. Seeing a filament glow does not a good tube make.

Neither my Sylvania tube manual nor a Google search list a 1EL7.

Have you looked for ti's manual?

Don't assume that a known good tube is still good. Test your tester
on more than one tube. If you are really lucky that will be the
problem.

Thanks for the tips:  meter movement works on line voltage set at mid
scale, so don't think thats the problem. Any idea what the internal tube
is for? I don't see a filament glow, but it's only a 1 Volt,
May have the tube number wrong.
What is the "ti" manual?

Yes, fuse in the A.C. line and is good. Turns on with needle at center
and line voltage setting works to put it right in center. After many
years of troubleshooting and doing restorations, this is the first time
I have looked inside a tube tester. Wow, what a wiring puzzle! I had
never thought about how they work, but guess there is actually a B+,
bias, etc applied as well as filament. Then is measures gain thru the
tube? Somehow?

It could be the rectifier(s), could be a DC amplifier, or both. Pull the
tube out and put it your freezer/refrigerator about 15 minutes. If you
still can't read the number accurately, then blow on it gently as if you
were trying to warm very cold hands. This should bring up the numbers.

(If it is a 117L7 it has a diode and a pentode)

In this case, it's woops! I meant "it's manual."

I entered my maximum bid last night before going to bed.  Turns out I
was the lucky bidder.  Got 'em for just under $35, but the final cost
will include shipping.  I'll complete the transaction this evening.

Thanks for the heads up.

There are two types of tube testers, those which measure only filiment emmision and those which measure transconductance. Most also test for leakage between elements or gassy tubes. Transconductance or mutual-conductance (different names for the same thing) have oscillators in them and measure gain. Most also test emission.

I am not clear on whether the tester fails with only one tube or with any tube. If its only one tube, or one type of tube, the chart settings may be wrong. This is pretty common. If it fails with any kind of tube the B+ maybe dead. I can trouble shoot some stuff without a schematic but its a pain to say the least and you are right about tube testers being rat's nests of wiring. If you have access to another tester test the tube in your tester if it has one.

The tube is probably an oscillator meaning the tester is
the mutual-conductance type which actually tests
amplification rather than just filiment emission.
Are you sure you are reading the tube type correctly?

```

I have for sale a Sencore LC-77 capacitor/inductor analyzer. This is cadillac instrument for measuring all the parameters of capacitors (leakage, ESR, value, voltage breakdown up to 1000 volts, value under various voltage loads, etc) and inductor measurements as well. I have the original cables, manuals and think I can even find the original box. This is what you need for in-circuit testing as well as bench analysis troubleshooting of all electronic equipment. This equipment has hardly been used and works like new. The front panel has touch membrane switches with a large LCD readout for all measured values. New cost was about $1800 and used values seem to be around $700 - $900. I want $525 for mine. Will box and ship (U-pay). If interested you can email or call Mike at (979) 696-4400. Located in 77840.

I wonder if anyone has tried to measure what voltages are there at the test
socket. Also the flip switches are most prone to loosing connection from
tarnish if there are no shorts from a wrong setup.

Test transformer. Usually some form of autotransformer. Tube inside is
likely a rectifier. Probably an emission only tester if it has only one
tube. (or multi section?)

Yes Dave;
I thought exactly the same thing but they were black as I remember.
I tried a WWW Search but nothing came up.

Too bad, these newsgroups are not what they once were for info:-(
73.......
Rich

Rich,

Yes, I know.
```

I started the transaction in the middle of a very nasty seperation
and it has taken me this long to get things back to a point that I can
resume
my radio habits.

It's been on my mind and I thought I would give it a try.

He was an older gentlemanm might not evenbe alive, but I wanted to
take a shot at it.

Harry

A nicely made radio anyway!
I once had a mint set of KW Electronics Twins.
The KW Altanta looks like a Swan 500, well similiar:-)
I shudda kept those as they were rare & beautifully made.
GL with the Auction.

```

Yesterday I bought, from a local Radio Shack, a Grundig G5 SWL receiver and found myself quite pleased with it and decided to share this with y'all. $150.

For some time I was looking for a replacement, new portable SWL receiver for my old GE portable SWL receiver (runs on 6 D cells, about the size of two big Kleenex boxes, and all of its switches, pots, varicaps are now all noisy as hell and hard to do anything with, plus other problems).

I was very interested to see, recently, that some (ham) handi-talkies now have SWL capability, and even SSB/CW capability. So, I was thinking about those, too, but the ones I asked about are about $300 each. More than I wanted to sink into a toy of this nature.

While in the RS store, they had a G5 sitting on the shelf and with good batteries in it (a good omen) and in ten minutes of fiddling with all the buttons to see how much I could figure out without reading the manual, I was encouraged to give it a try. You could not hear squat in the store, maybe because most of these new stores have metal 2x4s, metal roofs, and local electrical noise, but I had the hunch that maybe this thing was going to be decent.

Here's the short skinny: Its about the size of two king-sized cig packages. 4-AA cells. Comes with its own walwart AC supply.

Really nice performance on features I was interested in. the PLL local oscillators allow _continuous_ tunning from 150 kc to 29999 kc, on AM and SSB (and CW), and in one-kc readout steps on the digital frequency read out. For SSB and CW fine tuning, there is a vernier bandspread knob on the side which seems to give you something like a +/- 2 kc range for RIT, so you can get SSB stations tuned in if they are not on exact 1 kc frequencies (lovely!). It has an AM "bandswitch" button that cycles you up through starting frequencies of the major SW bands so you can tune to where you want to be more quickly. The manual tells how to do direct keyboard entry if you know the frequency you want to all digets, and that works, too. It also has 700 memories but I have not tried to learn the complicated process to use them.

So, sitting in my livingroom favorite chair (house is wood frame construction, no sheilding problems), I was tuning up and down the 80-75 meter to 20 meter CW and SSB bands, and with the built in three foot extendable "whip" antenna alone, was copying a large number of all of these stations (when the bands were open) all over. The frequency was also stable, at least over the time periods I was listening. Signal strength, receiver sensitivity was better than I expected.

There is a built in "S meter" with bar levels, but you only get five groups spread out from 1-9 (but, what else do you need?).

There is a two step switch for IF selectivity. Narrow (voice) and wide (music) that (I did not measure) feels like maybe 5-7 kc on narrow, maybe 10-15 on wide. You can easily tune both LSB and USB with the vernier frequency. But, in wall-to-wall crowded conditions, might give you trouble (qrm).

It also tunes the standard broadcast FM band (88-108), and in stereo.

There is a "local-dx" switch for attenuation for close, strong signals.

Downside: there are birdies and PLL noise all over the bands, poor image rejection below 550 kc, and birdies worse in some segments than others, but for the price and size, I'll live with that. There is a "lock" button that kills all access to anything and you have to read the manual to get it unlocked so don't push the lock button if you play with one. IIRC, you have to press and hold that button for more than 3 seconds to get it to unlock everything.

I had the impression that the receiver might be usable in a portable situation (eg motel, vacation) if you could bring a transmitter along and suitable antenna. The receiver has jacks for earphone, ext antenna, DC input, etc. An external narrow audio filter might help in the CW band if it is crowded.

Last but not least, I am not affiliated with Grundig, not related to anyone there in any way, this is not a post in response to some favor they did for me, in any way, shape or form. This is a pure FYI, FWIW "I was pleased with the unit" report and I'm going to have a lot of fun with it.

Hello Richard.

...and thank you for taking the time to share your thoughts.

Indeed I am quite aware that the reason for the bypassing of one of the RF stages was due to overload problems.
Perhaps when I wrote my posting I had not yet discovered that I was still sniffing out two distinct problems, which I subsequently have discovered.

First, some of the early SX-25s had two RF coils with two trimmers. For whatever reason someone disconnected both my antenna coil and the first RF coil. The antenna coil wiring on the "generic" schematic available everywhere is correct but the 1st RF coil portion is not if you have an early SX-25 with two RF coils.
True, the broadcast band (Band 1) skips over the first RF coil ostensibly to avoid the overload problems. I own two other (later version) SX-25s and neither even is fitted with the first RF coil "inside" the antenna-to-oscillator chain. I have figured out the wiring and my SX-25s works like gangbusters now.

The second problem...that my BAND 1 (broadcast band) was completely dead. I traced that to a missing jumper between the oscillator coil and the switch.

I am now experiementing with improving the Band 4 performance. Adding the shorted coil of wire to the RF and oscilllator coils is one way to go but I am not convinced that, with slight rewiring of the coil chain I can't provide an easier method of alignment by adding its own padding capacitor for Band 4. Incidentally, every SX-25 I have owned...including this early version I am now working on...have had the additional inductive turns already added. In one case the coils were all modified and sealed with either wax or Q-dope and then became covered with sludge from being submerged in a flood 60 years ago; so I know that SX-25 owners in the 1940s and 1950s were aware of the problem with IF tracking on Band 4 way back then. Adding the shorted turn to the coils only flattens out tracking from the bottom of Band 4 to about 30-35 MC anyway, so I am not convinced I can't come up with a better way. Any thoughts on adding a discreet padder will be warmly welcomed!

Thanks again for your thoughts and keep the spirit of glow alive. I am quite sure this antiquated, simple and humble technology will still be working long after much (most?) of today's junk technology has failed irrepairably.

My best,

W9STB

> I have the same schematics as you do, a Hallicrafters 1945 handbook from BAMA and a Rider's summary. Both show that Hallicrafters used an arrangement that is common in both H and other receivers with two RF stages , that is by-passing one stage for the broadcast band. I suppose its possible that both RF stages were used in early receivers. The reason for by-passing one stage is mainly to avoid overloading from the very strong signals often encountered from broadcast stations and another is to broaden out the RF bandwidth since this RX also has a broad IF response for good fidelity from BC stations. I think there are other H receivers which had such changes. Does the band switch have the requisite contacts for an RF transformer between the two RF stages? There should also be a trimmer capacitor for the coil or perhaps scars from one that was removed.
>
> I am trying to think of ways to find out what was there in case an old handbook can not be found.
>
> Hallicrafters seems to have changSed model numbers when making significant changes in design, i.e. S-40, S-40A, S-40B or S-20 and S-20R (R presumably meaning "revised").

I just snagged an old Instructograph "over there". It needs a Take Up
Reel. Anyone
have one or know if I can use and old film reel ?

Also, anyone know of a source of tapes ??

Tnx, Dick, W1KSZ

I cannot understand why you changed the heading and not just start
your own posting to advertise this SS, modern receiver on the
Boatanchors forum?

rec.radio.amateur.boatanchors:482

I have a Heathkit SB-401 transmitter that I=92m using as a =93slave=94 to a=
n
SB-301 receiver.  I=92d like to operate the transmitter independently,
but need a set of crystals to do so.

QUESTION:  Does anyone know of a source for Heathkit SB series crystal
sets aside from E-Bay?

-Dave Drumheller, K3WQ

Well, you didn't specify new or used...but I'm sure you know about

International Crystals (and other suppliers of new crystals). The only problem may be that a set of new crystals will cost you at least half of what the radio is worth.

Or, look around for a junker/parts 400 or 401.

Sure, call ICM.  Tell them you have an SB-401 and what frequencies you
want, and they'll cut them for you.  Probably about twenty bucks each.

Otherwise you can get junk crystals at a hamfest and recut them for
whatever frequencies you want, but it's a pain.

It's the kind of receiver boatanchor guys like to have around
when they are not up to hauling the vacuum-tube beasties out
on a picnic but want to listen-in to the nightly cacophony on
80 meters??

Except they aren't in a holder that can be opened by unscrewing them.
Few are likely to tackle sealed crystals, too much trouble to open (and
then close afterwards) and of course the crystal blank is not held in
place with pressure, so that's even more work.

ANd of course, you never could grind a crystal to just any frequency,
at least not at home. You could open up crystal holders held together
with screws and grind the blank a tad (or add a bit of lead from a pencil
to lower the frequency) but you had to start with a crystal on a frequency
quite close to what you needed, and this only allowed an incremental
change. Move it too much, and the person at home couldn't do it evenly
enough.

Who knows why he replied to an existing message, but obviously he had to change the subject header because whatever message he replied to wouldn't have been about this receiver.

He must be clueless, since he posted it to
   rec.radio.amateur.equipment
   rec.radio.amateur.boatanchors
   rec.radio.swap
   rec.radio.amateur.equipment
none of which really have relevance.

.equipment is about amateur radio equipment, and this isn't.

.boatanchors is about old and heavey equipment, and this isn't.

.swap is for buying and selling, and this isn't

I have no idea why he had .equipment twice in the newsgroup header.

And the one place where there is real relevance, rec.radio.shortwave is missing.

And he seems to be saying it's a lousy receiver (all those birdies) yet a good bargain.

Maybe he's saying that despite the digital readout it's about par with all those low end junk shortwave receivers we had to put up

with forty years ago because it was all we could afford, even if
they were never appropriate for ham use with the ham bands taking up a
quarter inch or so each on the dial, and the backlash for the tuning
was so bad that you had to tune out of the band before you could tune
back in.

That Grundig Satellite 700 that I bought a month ago for 2.00 at
the Rotary Club sale was a great bargain, and at least it is halfway
old enough to be a boatanchor. All those years of going to rummage
and garage sales and never seeing a shortwave receiver, and this is
the second Grundig I've found (and bought) in three years. I wouldn't
really use it as a serious ham band receiver, but it sure beats a lot of
junk from the old days.

Shorted turn were a common way of adjusting air core coils. The shorted turn method probably lowers the Q a bit but the range of adjustment does not have to be large. Another method of providing for some adjustment was to wind a few turns of the coil so they were separated from the main section by a space and could be moved. The change in mutual inductance would provide for some adjustment range. I don't know how to calculate padding capacitors from memory but the method will be found in books like the famous _Radiotron Designer's Handbook_ or K.R.Sturley's book, both available on the web. Personally, I would try the shorted turn method.

Again, there may be enough similarity in the later Hallicrafters receivers to provide a clue. I think the S-40/A/B was the replacement for the S-20.

Its something to be redoing the work of long dead designers:-)

Website:http://www.mobicoverter.com/

3GP/mobile/iPod/PSP Converter convert your VCD, DVD and AVI(DivX, MS MPEG4, uncompressed, etc), MPEG-1, MPEG-2 (PAL, NTSC), MOV, WMV, FLV and MP4 video files to 3GP, 3GP2 and MP4 files without knowing any technical jargon(such as Bitrate, Sample Rate, Frame Rate, etc) at all! So then you can transfer to your Cell phone, PSP and iPod, and enjoy them Anytime, Everywhere!

And we have provided dozens of codec profiles for most popular cell phone, such as Sony Ericsson, Nokia, Motorola, Samsung, LG, Simense, Pansonic, Sanyo, NEC and so on. What you have to do is simply launch the software, and pick up your model!

No, Mike, ignoring k00ks (such as my obsessed little slave, Punceorama)
never works. An essential part of what makes them k00ks is an absolute
conviction that they are right and correct in all they do, and that they
can therefore do whatever they see as necessary, up to and including

real-life stalking of anyone deemed to be an "enemy", or even assault,
kidnapping, and murder.

"Immorality: The morality of those who are having a better time." -- H. L. Mencken

"Consider that language a moment. 'Purposefully and materially supported hostilities against the United States' is in the eye of the beholder, and this administration has proven itself to be astonishingly impatient with criticism of any kind. The broad powers given to Bush by this legislation allow him to capture, indefinitely detain, and refuse a hearing to any American citizen who speaks out against Iraq or any other part of the so-called 'War on Terror.'

"If you write a letter to the editor attacking Bush, you could be deemed as purposefully and materially supporting hostilities against the United States. If you organize or join a public demonstration against Iraq, or against the administration, the same designation could befall you. One dark-comedy aspect of the legislation is that senators or House members who publicly disagree with Bush, criticize him, or organize investigations into his dealings could be placed under the same designation. In effect, Congress just gave Bush the power to lock them up." -- William Rivers Pitt

"It has become clear in recent months that a critical mass of the American people have seen through the lies of the Bush administration; with the president's polls at an historic low, growing resistance to the war Iraq, and the Democrats likely to take back the Congress in mid-term elections, the Bush administration is on the ropes. And so it is particularly worrying that President Bush has seen fit, at this juncture to, in effect, declare himself dictator." -- Frank Morales
http://www.uruknet.biz/?p=m27769&hd=0&size=1&l=e&fark

"Right you are correct. Someone hooked me. I do believe in building relationships. That is what Christians are required to do. I am amoral. I am sure you know what that means. So are Scorpios. I am being 'protected' by the Formosa Rule because of my 'mental illness'. I am not targeting 'teh Mop Jockey'. You are and you are using me as a bait. Please stop. I have my own fish to reel in. Leave me alone. It is my hope that I will be able to catch a fish and reel it in for you. Once my retired bishop thought I was fishing for him and he took the bait, alas it wasn't me and that spelled the demise of our relationship. Have a little bit more faith in me. An Eastern Orthodox bishop thought I was fishing for him and willingly, proudly and defiantly took the bait on public record, and it wasn't even me. Give me a break." -- Atlanta Olympiada "Erica" Kane yammered in
Message-ID: <ochc3.ag0.17.1@news.alt.net>

"It does to a certain extant physically and theoretically

it holds even into the quantum but there observational confirmation is limited or non existent. That's the problem and the major stumbling block to field unification. For Dr. Einstein held out that a physical based field theory should be sought out and not left to quantum uncertainty of how the universe primly base works. Man made coordinate systems are fine without knowing from where or what is the base essence of what the space as deduced field is composed of, but not totally satisfactory. Anomalies keep space cropping up and scientists have to keep adjusting for these unexpected events. It's like a blind man that has memorized his physical surroundings to a point he feels very comfortable until that one new or unexpected event pops up and he's lost and fumbling." -- nightbat, in one of his more lucid moments.

I did hundreds of those things when I was a kid, peeling open the crimp on the bottom of the case, and lapping them down in the sink.

>ANd of course, you never could grind a crystal to just any frequency,
>at least not at home. You could open up crystal holders held together
>with screws and grind the blank a tad (or add a bit of lead from a pencil
>to lower the frequency) but you had to start with a crystal on a frequency
>quite close to what you needed, and this only allowed an incremental
>change. Move it too much, and the person at home couldn't do it evenly
>enough.

I started out using Ajax cleanser and my finger, which does not allow much change... you can go up a little bit but as you note it becomes difficult to keep the sides parallel.

I wound up using pieces of window glass, with the blank sandwiched between them, and with lapping compound from the auto parts store. The window glass etches away faster than the crystal, but by holding the two sheets together you can get remarkably parallel faces on the crystal and you can move 500 KHz or more.

Incidentally I destroyed the finish on the bathroom sink in the process,
with stray lapping compound, and my mother still has not forgiven me.
I will say that I am much older now, and nowhere near as impoverished,
and if I need a crystal today I pick up the phone and call ICM.

We just updated our catalog with some new pricing, closeout products,
and more. Please come visit http://www.thetubecenter.com to check out
our site, and products. The tube center is dedicated to bringing you
the best tubes for your buck, and I don't think you will be able to
find prices like this anywhere else in the united states.

So Come Check Us Out!
http://www.thetubcenter.com

Thank you
The Tube Center Webmaster (chris)

This is the type of item that makes ebay worthwhile no matter how much one may prefer to avoid it. Sort of like a year round flea-market. The missing ones from your rig possibly went there since its somewhat difficult to sell that type of thing (and get a decent price) at limited venues.

Good luck!

Yeah, I think you're right. I'll keep an eye on Ebay. I'm in no rush
to get the crystals.

I'm fascinated that some of you have successfully re-ground crystals.
I wouldn't have thought it possible.

Thanks everyone.

If the crystals were WWII or earlier they might respond to regrinding, I
have done that
with polishing compound and a piece of glass to work on.

BUT the crystals in a Heath SB series are probably gold plated and the
crystal support
is by two wires that are bonded to the gold plating. Then there is the
welded case to consider.

So I would not suggest regrinding that new of a crystal. The WWII
crystal holders are
to large to fit in the SB series equipment so shouldn't be used

International Crystal would be a good source as they will be on
frequency and some of old
surplus units may have aged and are now off frequency.

Just my two cents worth

Jim, I interpret your comments as seeing what I was trying to do...just share that this would be a nice little receiver with serious enough capability for a range of capability including "reading the mail" on ham bands. If I were to guess what is bothering Richie, it is that some newsreaders and news handling services handle some posts based on internal ID numbers rather than subject lines and other ISP services handle these the other way around. I have no idea why people get bent out of shape so much if something shows up in their thread that makes no sense because their service holds a post in a thread even though the subject line changes.

I am still tickled to pieces with my G5. Almost fee like a kid, again, with a precious new toy.

Hi,

I've used these guys before. I can confirm their quality and service.

Cheers!

Hi A;
I have no problem with reading your info about this receiver & cud
care less where you posted it.
Each to thier own.
I just figured you'd get more exposure iffin you started your own post
& not dump on some one else's is all.
No Harm done.
I have a few Older SS SW receivers that I use also like my CRF-150
Sony, its big enough to almost qualify as BA Status, hi!

Rich,

I don't remember his call. I think his name was Bob and he lived in
Ohio.
I thought it was on this list, but now I recall as I write this, that
I was also on the Drake list.
Think I will try there. Appreciate you thoughts.

Well, I did partly explain in my most recent comments that how the internet and newsreader software and news servers operate is not uniform. If you have a threading newsreader, then the post MIGHT stay in someone's thread. If you don't have a threading newsreader, then the post will appear under its own title (which I used). And, in some replies, people sometimes edit out the crossposts but sometimes do and sometimes don't know they are doing that because there may be defaults beyond their control. What I recall doing was take someone elses already listed crosspost and edit the subject line. That SHOULD have dumped it outside of the thread, but not in all cases.

> No Harm done.

Some harm is done when people reply to one post in a thread and don't include enough of what they are responding to to tell what the reply is replying to. I am never bothered by almost anything on NGs anymore. Everyone has their own "standards" and a lot of people like to play "policeman" however. For a lot of NGs out there, the quality of material coming out these days is a lot poorer than 10-15 years ago, too.

> I have a few Older SS SW receivers that I use also like my CRF-150
> Sony, its big enough to almost qualify as BA Status, hi!

I happen to have a lot of nostalgia for "classic" stuff, but at my age, size, weight, and convenience cause me to "rather switch than fight" (if you get my drift). Otherwise, 73.

I had one of these about 30 years ago I bought at a yard sell I think
it actually had three RF coils. It had one for the antenna, one for
the first preamp, and one for the second preamp stage. I took it to a
guy in Willacoochee, Ga to get it fixed. He took a few voltage
measurements, replaced a couple of tubes and resistors and tuned it
up. I think he could tell what was wrong with it from the way it
smelled. Unfortunately it and my S40B were both stolen out of storage
about 5 years after I got it. The S40B was in near perfect mint
condition with all the origonal Hallicrafter tubes.

This really is your lucky day. There's not one but TWO sets listed on
ebay at the moment.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=200237031150
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=260261438295

I checked the manuals and the 401 and HW101 apparently use the same
ones. You might want to double-check that for yourself just in case
I've made a mistake.

GL,

Bill WX4A

Several years ago a friend gave me several 304TLs. He didnt want them
because they were gassy(glowed blue). This was about 1971. Two of the
tubes still work fine used in a stereo amp, a couple more I gave to a
friend building a modulator the others still sit on the shelf in case
i ever need spares.

A nice cobalt blue glow isn't gas, but rather is caused by electrons
hitting a slightly fluorescent glass. Some tubes have areas in the
plate that can leak out electrons from the cathode. They will glow
blue from the very start.

Usually, a gassy tube will glow pinkish, and the glow will be situated
inside of the volume surrounded by the plate.

Chuck: Yes that's logical and I would defer to your knowledge of tube
manaufacture. That's why it was worded 'MIGHT' be possible.
Thanks for the comment additional info.
Terry

My HQ145 performs beautifully also, repaired by Paul at Antique radio
Consignment center in St Paul MN. Just one question: On broadcast band
sensitivity is fine until you go below 1000KHz. Then, very insensitive. Any

ideas?
Thanks, Tom

Hello fellow glow worms...

Does anyone know of a source for very thin mica suitable for my rebuilding
trimmer pads? I've been using clear plastic but results have been
unremarkable and think if I am going to do this I should do it right.

I'm looking for some that might be arounf 0.003-inches in thickness +/- .

Thanks.

W9STB

I purchased a sheet of mica from this guy once:
http://www.dialcover.com/home.html

I do not see it on his site any more. I could have missed it.

Also consider an old toaster from the Good Will or Salvation Army and
recycle the mica.

Sorry I can't be more helpful.

Given today's EPA driven society, your best bet may be an old toaster
at your local Goodwill or equivelant store and an X-acto knife.

I'm sure this is not the best answer to the problem, but when I've needed
a particular padder/trimmer rebuilt, I looked to other old padders/trimmers
for "new" micas. Often
the junkbox has old padders (higher capacity ones had lots of mica
dielectric sheets).
You can "make" smaller capacity trimmers by removing plates (and their mica) from
larger capacity ones if other problems exist (like broken ceramic body)
But I'm pretty sure you may already know all this.

I too have repaired/ modified them by scrounging insulation and parts from other trimmers. I have considered replacing some with Teflon. The dielectric constant is not the same but you may be able to compensate for this using thinner material. I have used PTFE in a couple of screen bypass caps where the mica had broken and it worked well. I actually got an increase in the amount of capacitance even though the dielectric constant for teflon is less than mica. I have also tried getting mica out of an old toaster, this didnt work as all the pieces I found were so perforated as to make them useless.

Try your local hardware store. Ask for a replacement
"mica window" for a wood stove. Peel and cut to
thickness. EPA does not regulate mica, it is harmless.

Depending on condition, the Collins Gold Dust twins have done
well for holding value. You should really do some research into
what they are worth before listing them anyplace. EBay will
give you the best exposure to the largest market, but unless you
specify local pickup only shipping could be a problem.

Pete

If you are really losing sensitivity on one band here's a few
things to look for:

1: Open antenna coil winding on the first RF coil for the BCB.
Even open, there is enough stray capacitive coupling to provide
somewhat of a match at the high end of the band; but
not enough at the low end.

2: Bad alignment on that band; the LO and RF stages are not
tracking each other across the full tuning range.

I'd be asking Paul why his repairs aren't up to snuff myself.

With there now being a spot of getter metal on the glass in the vicinity of
the getter loop, I'd think that applying intense RF energy to the area would
also heat that spot (the way silvered or gilded patterns on a china plate,
or even more dramatically the coating on a CD, heat up and spark in a
microwave oven). Assuming this heat was enough to re-vaporize part of the
spot, and the glass didn't break from the thermal shock, I'd wonder if the
vaporized metal might capture enough extra air in a slowly leaking tube to
make a difference for a short time.

you could try transistor insulating mica..
The thicker types can be split with a boxcutterknife.

Re-heating the getter flash might work, but it also might release all of the
gases the getter trapped on the first go around. It depends on what happens
when you heat barium oxide, barium nitride, barium hydride, ... along with the
barium metal, to a few thousand degrees F in a vacuum.

And, the getter does nothing towards trapping helium that diffused through
the glass... though that shouldn't be too much of a problem, as helium is
rather scarce in our atmosphere.

Remember, it's a reactive metal.  When it's worn out, it's worn out because
it's oxidized.  Reheating it won't do any good; you have to get the oxygen
out of the tube.  At best, reheating will boil off the oxygen and fill the
tube back up with it.

I've bought a 30s vintage homebrew ham receiver that I plan
to restore. It's really nicely built with the exception of not having
any decent labeling of the front panel controls.
I seem to remember seeing ads in 30s QST and such for the little
metal tags with function names on them for use on home built radios.
Does anyone know of a source for these old tags, OR does anyone
have a stash of them in their junk box???

Right now all it has for control tags are old style Dymo labels.
I need tags for; Volume/AF Gain, RF Gain, CW Osc, Power, H.V. On/Stand
By-Operate, Crystal Filter, Headphones. Or variations of these.

I've started a web page to document the restoration project, check it
out
if you're interested.
http://radioheaven.homestead.com/HomeBrewRX.html

Are those still being made of mica? SOmething about the texture of
those I've handled recently make me wonder if they've come up
with a synthetic.

```

I have managed to keep the infinite impedance detector, and make it switchable between it and the plate detector.
The 6sn7 was configured to use 1 section for the bfo and the other section for the new detector, which plucks the signal from the if transformer. After that odyssey and replacing some wrong-value resistors, also found the oscillator fixed pads were monkeyed with, and the band six pad had a broken solder joint. Looking forward to the next re-alignment, also with all NOS tubes. Have made a lot of progress, thanks for your help.
Ben

Test Preparation Software

Pass your US FCC ham radio license test with ease. Our test preparation software
serves as a training aid to help amateurs and prospective amateurs pass the VEC's administered test. When you can consistently pass the test given by our test preparation software, you will almost certainly pass an actual test.

Our ham radio license test preparation software uses the latest officially released VEC's approved question pools. The program breaks the test into different sub-element. Integrated into the software are illustrations and Part 97 rules pertaining to the current question. The program tracks the progress of the tests taken. Once you have mastered each sub-element you are ready for the official test.

Visit our web site at http://www.hamradiolicense.net for more information.

Hi Rich

I take it that was the larger two knobs? What size is the volume knob?

I'm looking for a donor for my HE-10 and HE-30 and the HE-40 knobs
looked close.

Peter

Hi, I've recently purchased an old BC348 but at some time in it's
history someone has removed the ID Plate that is fixed to the front
panel, has anyone in the group got an old wrecked 348 with one still
on it, or perhaps knows where I could source one?
thanks from Ron...

Both larger knobs at either end, measure 1-5/16" in diameter.
I checked my HE-40.
Hey, if you put on 2 knobs the same size & design, no one would know.
Even if you used all the same knobs:-)
Rich

Hello Glowguys,

I am working on a Hallicrafters SX-25 that has a specific li'l nuance (or better described, NUISANCE) and I am hoping someone out there can help me.

The SX-25 has TWO RF COILS for the standard broadcast band (Band 1) preceeding the First Detector/Mixer/HF Oscillator. Both of these coils were disconnected prior to my obtaining the rig for some unknown reason (the coils are fine, I've got continuity through the primary and secondary of each). HOWEVER I also own two other SX-25s and when I compare this one to those I find the other ones only have ONE RF COIL ahead of the First Detector/Mixer/HF Oscillator for Band 1.

H-m-m-m-m.

One suggestion I received was that the circuit of the early run SX-25s was very similar to that of the SX-17, so I compared the SX-17 to the '25 however it shows the antenna jacks connected directly to the 1st Detector/Mixer and completely bypassing the RF AMP stages on its Band 1 (standard broadcast band).

My Band 1 is dead but I have goot perfecormance now on Bands 2, 3 and even pretty good performance on 4.

Does anyone have an early run SX-25 and can tell me how these coils are wired? I've experiemented with a lot of logical combinations I thought might be possible but none seem to bring in the ball game and neo-conservative dingbat talk shows for me.

Every schematic I have ever seen for the SX-25 (including those on BAMA and the originals I own) show only one RF coil in use for the the standard broadcast band, so if you've got an earlier schematic I WILL PAY MOOLAH for it.

Thanks for any help you can toss my way.

Hi Vern,

Have you tried wiring it like the schematic you have?

Hi;

Anyone know the history ? Why Nye Viking went from WA to ID ?
Was the MB V A tuner made the same way in Idaho as it was in Washington ?

Is there any component or construction difference between the two units ?

Thanks,

Bob

Hi Bob;
Good Question but I cannot help you.
I also have 2 Nye tuners, 1 is an MB-VA and the older one is one with
only one meter & plain rotary switches, both made in Washington state.
I do know that when they first started out, thier tuners looked like
the big 'ol Johnson match-box except they were sorta black instead of
Johnson Maroon.
I think they acquired that Johnson line & made them the same until
they designed thier own.
73 Bob,
Rich

I'm taking the following to the Howard Co (MD) and Berryville (Va) fests later this month:

Hallicrafters SX-117 and matching speaker. book. Exc $325

Lysco Model 600 Transmitter with Lysco antenna tuner, Exc. $175

Drake SPR-4, book, Drake RTTY, Calibrator, and Transceive mods inst.
Exc. $325

National NC-183D, book, fairly nice/working cond. re-capped $280

AN/GRR-5, Receiver. VY Gud, book, canvas covers, antenna, ac cable,
headset cable, $250

URM-25D VLF/MF/HF Signal Generator, VG+. $100

RME 45A (late) and matching spkr, re-capped, very nice cond. $325

If interested, contact me and I'll reserve them and/or drop by the QTH in central MD.

de K3HVG

Hi Brian,

Thanks for your suggestion. But that was one of the first things I tried and it left one RF coil unwired.

Anyway, I have been plugging away and I think I have it wired correctly...at least it seems to work well wired this way. I am redrawing tyhe schematic for the SX-25 to incorporate the two coils and if anyone is interested drop me an SASE at my QRZ.COM address.

Keep 'em glowing!

W9STB

Bob,

Nye Viking was originally run out of Washington but when the son took over about 1996 he moved Nye to Idaho.

Nye Viking bought the Viking name from EF Johnson. He only built the speed key and the tuners. The Nye Viking tuners were not the Viking 250 or KW tuners but an entirely new set of tuners. There is a review in QST back in 1992 by Jim Cain.
The Nye tuner is not very good for 160. Please read the article though.

Hi Dave;
I have seen the very first Nye Viking tuners, it was built exactly
like the Johnson KW tuner, same size, knobs in the same place, the
color was different though, etc.

I never looked inside.
So wat are talking about, where can I read this, online?
I am going to check around!
The newer ones like the MB series were completely new designs.

Hi Group,

This is a bit of an odd request.

4 years ago I put a deposit on of Knight t-150
from a member of this group.

I was wondering if this person is still onthis group and remembers me.

If so i would love to see if this item is still available.

Thanks
73

I have the same schematics as you do, a Hallicrafters 1945 handbook from BAMA and a Rider's summary. Both show that Hallicrafters used an arrangement that is common in both H and other receivers with two RF stages , that is by-passing one stage for the broadcast band. I suppose its possible that both RF stages were used in early receivers. The reason for by-passing one stage is mainly to avoid overloading from the very strong signals often encountered from broadcast stations and another is to broaden out the RF bandwidth since this RX also has a broad IF response for good fidelity from BC stations. I think there are other H receivers which had such changes. Does the band switch have the requisite contacts for an RF transformer between the two RF stages? There should also be a trimmer capacitor for the coil or perhaps scars from one that was removed.

I am trying to think of ways to find out what was there in case an old handbook can not be found.

Hallicrafters seems to have changSed model numbers when making significant changes in design, i.e. S-40, S-40A, S-40B or S-20 and S-20R (R presumably meaning "revised").

Rich,

I did not know Nye made the exact duplicate of the KW matchbox. I am
betting he bought out the remaining stock and relabeled them. I saw a write
up on Nye somewhere but cannot remember where. Jim Cain K1TN might have the
info as he wrote the QST review in 1992.

Since I started this project I've been posting notes about it to
various
email groups.
In an effort not not to annoy those that are not interested in what
I'm
doing,
I decided to created a new web page, a project notebook of sorts.

I have included all the main messages I have sent so far via email
with
the dates sent.
When I add a new entry I will post it to the top of the page so it's
not
necessary to go to the bottom to see the latest addition.
Here is a link to the notebook page,
http://radioheaven.homestead.com/HBRXnotebook.html
There will also be link on both of the other project pages.

So now all you have to do to see what's the latest on the project
is just go to the project notebook page.

Thanks bunch for everyone's support and suggestions.

73, W4Ron

I=92ve finished refurbishing a Heathkit SB-401 transmitter, but have one last problem to fix: 60 Hz tunable hum audible on the output. (Hum modulates the audio.) I=92m using it as a =93slave=94 to an SB-301 receiver, so it uses the various oscillator signals generated by the receiver. The receiver performs flawlessly, so I know those signals are clean. Some comments and questions:

1) Heater-cathode leakage is a possibility. I plan to check this by swapping tubes, but spares won=92t arrive in the mail for a day or two. However, if one tube has this problem, can it foul up the cathode emission on all other tubes sharing the same filament transformer, thus making all tubes generate hum?

2) If I pull the mic amp tubes the hum is still present on the unmodulated signal. However, I notice that plugging a microphone into the transmitter can make the hum worse.

3) Are there any problems particular to the SB-401 that may cause this? (Just trying to tap into the collective wisdom out there in Vacuumland.)

I=92m trying to get this unit ready for Field Day (this coming Saturday), and I know hum problems can be difficult to fix--Help!

I�ve finished refurbishing a Heathkit SB-401 transmitter, but have one
last problem to fix: 60 Hz tunable hum audible on the output.

If it is "tunable" hum, heard only locally, why are you worried about
it? That is being generated in the receiver, not the transmitter. Do
distant stations hear the hum? That is the question.

Sorry, I wasn't clear.  When I listen to the SB-401 transmitter on a
shortwave receiver, I hear hum modulation.  The SB-301 receiver, which
drives the SB-401, works fine.

Be sure that what you are hearing isn't the shortwave receiver being
overloaded by the transmitter. I find it is rare when I can receive
a local tube type transmitter with a local receiver and *not* hear hum.

-Dave Drumheller, K3WQ

Hi Dave

Yes, I understand. But remember you are listening to the transmitter in the near field, which means a substantial amount of RF is being carried on your house wiring. The hum you are hearing may, or may not, be actually present in the transmitter's RF output.

Tunable hum is not the result of a problem in the transmitter signal, it is the result of RF being carried on the power lines (common mode) causing a sixty cycle variation in the RF received signal. The hum appears same as if the carrier is being modulated by a signal cycle signal.

You need to have a local amateur (within a few miles) listen to you signal to determine whether the hum modulation is real, or is an artifact caused by RF interaction with the shack's AC wiring.

Peter, K1ZJH

Thanks to all who helped with good information on restoring this almost pristine condition radio to its former glory. I had it recapped, fused the chassis, aligned and it needed three new tubes. Now it is hooked up to a 30 ft. wire and pulling in stations like crazy! I really enjoy twirling the knobs on this old girl and just makes me wish that I could have had this radio way back in Jr. High/Sr. High instead of the lousy S-120! Now I know the quality and build of the Hammalund line.

Thanks, Peter. I hadn't thought of that.

One more point of clarification: The SB-401 is driving a 50-Ohm dummy
load next to the bench. The shortwave receiver (actually, my Icom 718
solid-state transceiver) picks up the signal using a short length of
wire draped next to the dummy load. Do you think this arrangement
induces the hum modulation as you suggest?

This is helpful--and also good news. Maybe nothing's really wrong
after all!

Hi Dave.

Over the years I too have run into the same situation and what the fellows here are telling you is most likely correct. I can also tell you the you don't need any antenna to pick up that transmitter when it's that close. In fact you'll do better if you don't use an antenna or something very short to get a better picture of what your xmtr sounds like. This is one time where an RF envelope monitor scope comes in REAL handy. If you have hum on the transmitted envelope you'll see it on the scope.

Glad you were able to get it aligned properly. That is the most common problem with the 145. The 145 has a lot of the HC-10 circuitry incorporated. Once done correctly it is a great receiver.

Agree with you completely about the S-120 type receiver.

Thanks, Kim. As recommended by another poster, I think the best
course of action is to use an external antenna and make a few contacts
to get signal reports.

You=92re right about the monitor scope. There=92s a companion Heakthkit
SB-610 Monitor Scope that I don=92t have, but could use right now.

You mentioned that when you plug in the mic it changes the hum
level,,This may sound too simple,, BUT,,Always bond all items together
(Rec,xmtr,spkr,etc)and to a good earth ground.They used to call it
GROUND LOOPS, I never figured exactly what a groundloop is ,,I do
understand grounding and I hope you have done that first..OK  W4PQW
PS   (I think a groundloop is when you deliberately wreck your
airplane  at the end of the runway just before you kill yourself..)

I also suspect a ground loop, although a ground loop is more common in a mobile installation. The common mode modulation is also common in direct conversion and regen receivers. In those cases, it is solved by rf chokes in the power supply circuit, isolating the power lines from any rf getting back into the power supply. Hopefully, there is no real problem, but if there is, isolate the power line from rf - perhaps both on the receiver and transmitter.

And, it seems kind of early to check the equipment out for Field Day, isn't it? That is something you are supposed to start Friday night and then have to stay up all night to fix it, so you can start Field Day bleary eyed. Seems almost unfair to check this stuff out now.

73, Colin K7FM

Me agn Dave!!

The other model is an SB-614 (I have two) and it works better. For a C note it's a good deal and if you're gonna do a bunch of transmitter resto work, it's the ticket

Hi Gang!

Yup, run into groundloops too. But that usually only occurs when more than one piece of gear is plugged into more than one side of an electrical service (3 phase) and an electrical imbalance is present. Now an open or poor ground is different. However that would create a LARGE increase in hum and probably would result in a very poor audio signal received, probably not understandable as close as Dave is to the receiver with the transmitter. His mic, however will pick up some noise from his hand picking up the mic, even when it's properly grounded and shielded. What we have no way to tell is what that hum sounds like and how loud it is in relation to the actual signal. Most likely, it's proximity effect as suggested to begin with. I have had some AM transmitters (Johnson and Heath) that suffered from inadequate power supply filtering, but even that wasn't really noticeable to a station even 5 miles away. Extra filtering took care of a lot of it, but it was still there on a receiver 10 feet away with no antenna.

One thing that wasn't mentioned was the possibility that one of the cables that interconnect the two pieces of gear, if he has them cabled up to work as a transceiver COULD have an open shield and that could account for some introduced hum that gets louder with the audio, since this is a heterodyne type transmitter, and not a phasing rig.

I just recapped an HQ-145 that I've had for about 10 years. It was a
'throw-in' with a Heath SB-200 I bought from an estate. It seemed to
work pretty well with just an improvised antenna. I would like to get
it on the air, perhaps with something like the Viking Adventurer that
I had when I was a kid. I sort of wish I still had the Johnson Ranger

I that I built when I was a late teen. I of course have modern equipment as well now...Icom gear...but I think it would be fun to see what I could do with something like the rig I had as a young teen. My receiver in that era (mid 1950's) was an HQ-100, one of the first ones they made. I ordered it when it was first advertised, got it as a Christmas present when I was 14, but didn't actually get until a month or two later from the firm in my home town owned by the father of the fellow who founded AES.

The HQ-145, which didn't come out until later would have been my dream receiver at the time, short of Collins gear which was an impossible dream on a kid's afterschool wages. It was introduced just as I was going to college. I was licensed in Jan 1956 when I was 13. I used the Ranger/HQ-100 for about 4-5 years in the late 60's after college once I got into my first purchased house. By then it was pretty much obsolete for phone and the Ranger didn't do SSB, but I worked about 60 countries with a vertical from a town house on CW.

I'm going to be the killjoy for the easy solution. :) I had a Galaxy 5
with external VFO that did something similar. I forget all the details
but in one of the modes (trcv or rcvr-xmtr or xmtr-rcvr) I got hum
modulation that was apparent on transmit. I could also hear it on
receive without even activating the xmtr.

A previous owner had shielded the cables inside the VFO and done some
other stuff and apparently struggled quite a bit to solve it. I
couldn't resolve it either. I just accepted not to use that particular
switch position.

Gotta be some weirdo ground-looping issue. I know the older Drakes
(twins) were very persnickety (sometimes) about the interconnecting
cable lengths.

If you do figure yours out be sure to post the solution here. I'd be
very interested.

Test Preparation Software

Pass your ham radio license test with ease. Our test preparation software serves as a training aid to help amateurs and prospective amateurs pass the VEC's administered test. When you can consistently pass the test given by our test preparation software, you will almost certainly pass an actual test.

Our ham radio license test preparation software uses the latest officially released VEC's approved question pools. The program breaks the test into different sub-element. Integrated into the software are illustrations and Part 97 rules pertaining to the current question. The program tracks the progress of the tests taken. Once you have mastered each sub-element you are ready for the official test.

Visit our web site at http://www.hamradiolicense.net for more information.

I don't have any spares in the junkbox, but AES has them for a couple
dollars each.

If you replace them with a zener string, it will cost more than an OC3
replacement, but it will be quieter. Adding a 1uF film bypass to the
zener string, as close as possible to the caps, and putting the whole
thing in a metal can can really help noise.

Hi All;
I've been saving this for years but now realize that I'll never get to
build a small CW Xmtr so its time to move it to someone who can put it
to good use.
Stancor( Chicago Transformer Co.), Model PC8411, 4 hole, above the
chassis mount, enclosed.
   All wires are uncut & original length, some surface rust on the
laminations, Bells are fine as is the yellow label.
Primary Voltage = 117V. 60 Cy.
Secondaries= 375-0-375 @ 150ma dc
Filiment= 5.0v @ 3A.
Filiment= 6.3v @ 4.5A
Weight shipped about 8.5lbs

Price is $60.00 with Priority mailing .
Will make a nice transmitter supply.
Tnx & 73.......
Rich WA2RQY/4

Hi, Gang

I've been communicating with an audio engineer
named Brad Banks, who came across an HP-616A
and the military equivalent, model TS-403B/U.
Both signal generators cover 1.8 to 4 GHz, using pulse, c.w.,
or FM modulation, and have precision attenuators.
He wants them to go to a good home -
available for pick-up in Brooklyn NY.

The HP-616A sold for $1,950 in the -hp- 1953 catalog,
the price of an automobile at the time.
It uses a Klystron oscillator tube in a tunable cavity.

The units appear complete, but are untested.
Photos are available.

If interested, please contact banksbrad at hotmail.com
(not me).

Thanks,
Ed Knobloch

David-

When I saw the word, "tunable", the first thing that popped into my mind was "parasitic oscillation"!

You might recheck neutralization of the rig's finals. The manual probably covers it. One thing to check, is to see if the plate current dip corresponds to peak power output.

One of the things that I forgot to mention is the fact that Heath rigs like (read engineering requirement buried in one of the manuals) to use RG-62 cable to interconnect them. That cable is 93 ohm coax and they really like to all be the same length (memory is returning from antique radio resto). I ran into something like this back many years ago when I ran this same set of rigs. One more thing to look at is the 6D10 that is in the 401. They can develop heater to cathode shorts and the same thing will happen.

I might suggest a Collins test to check whether you really have a problem or not. Tune up the rig following the book procedure for full output. What you're using is the unbalanced modulator in Upper sideband to create output. Then, without touching anything, disconnect the mic and ground the pin that actuates the transmitter, watch the plate and grid current to see if any actual drive exists, and them listen to it on another receiver. You ground the mic connector pin with something really short to the case. If your carrier is WAY down and is fairly clean, and its gets hummy, dirty with the mic connected, it's your mic or cable. If there is only a small amount of hum there, when the mic is connected, you probably don't have a problem, you just haven't done this particular type of thing before and you are, like my Golden Retriever, chasing your tail.

An RME-84 was donated to our church garage sale. I would like to sell the radio to someone who will enjoy owning and restoring it. This group seems like a good place to start.

I've posted pictures at http://www.menopausalmomma.com/rme84/

You can see that there are some scratches on the speaker grill which have removed the outer paint in small places. There are a few more minor scratches in various places, and one larger one in the upper right corner of the front.

One tube has been replaced with a "modern" replacement at some time in the past.

All-in-all I think it's in pretty fine, but not perfect, shape cosmetically for a radio from the late 1940's.

All dials and switches work smoothly, except for B.O Pitch, which spins freely and acts like it isn't connected to anything.

Against all advice I now find on the Intenet (I should have looked before), I attached a 20 something foot zip cord antennae and fired it up. It warmed up nicely and I easily picked up AM stations. Sound was decent. I picked up some religious thing on one of the other bands.I ran it for about 10 minutes with no problems, and then shut it down

We don't want to get an outrageous amount of money, but do want to get a fair price. On the other hand, the only prices I can find on the 'net are from around 1999 or 2000, so I'm not quite sure what a fair price is in today's market.

The radio is located in Omaha Nebraska. It would, of course, be best if the buyer can pick it up. If it must be shipped, we will pack it carefully (following any special instructions from the buyer), and ship it at cost.

If you are interested in purchasing it, contact me off-list with an offer or questions about the unit.

Doug Swartz

Well, I solved the problem. It was feedback due to close proximity of
the transmitter and receiver, just as Chuck, Tio and Kim suggested.

Tio recommended an on-the-air check, and that=92s what I did. I erected
a makeshift 80-meter antenna in the backyard--good practice for Field
Day--and called CQ. A station in New York replied. He reported that
my audio was fine, with no hum modulation.

What a relief! Thanks again for all the suggestions.

I found this bakelite unit at a local
hamfest, and am replacing a deteriorated
line cord. It has wattmeter and
voltmeter movements opposite one another
within one face, and will read switched
500/1000 watts and 0-130 VAC/DC
It looks 1940-ish. If anyone has an ad
or catalog listing, I'd appreciate a scan.

73,

afcsman--W9NPI

Hi.

I got an RCA MAR CRV-43067 receiver/transmitter last weekend and was
looking for information on it. I opened it yesterday and looks
extremely clean inside.

Any information will be greatly appreciated.
Thanks

The following web page shows several photos of vacuum tubes that glow because they=92re either gassy or induce florescence in the their glass bulbs. Although the English is a little choppy, the narrative and pictures are informative:

http://www.jacmusic.com/html/articles/blueglow/blueglow.htm

The author claims he=92s revived gassy tubes by re-heating the getters. Has anyone tried this?

-Dave Drumheller, K3WQ

I was lucky enough to get a tour of Richardson Electronics (outside of Chicago) a few years ago, and asked their tube people about this. The answer I got was an immediate NO.

Apparently, if the getter is properly zapped in manufacturing, there
is no Barium left in the getter loop. It's always possible that some
tubes didn't get properly zapped, but this should be a long shot.

After nearly 20 years of silence, the Amateur Radio Forum is back on the
air.

Politics, religion and all those subjects people shun on the air are
fair topics for ARF.

This week we discuss The Statue of Immigration, a Gift or a Plague.

Thursday 0200Z 3715 AM with sidewinders welcome.

Last week's topic is at: http://k9act.blogspot.com/

Jack K9ACT

Noon Time Forum, M-F 3875 Noon CDST

Hi Gregg,

Thanks for visiting and commenting on the site. Yes that would be me
giving him a hand, started here in March and I am still amazed that
there are 3.5 million tubes in our warehouse. Keep coming back cause
we have plenty of tubes for you.

Thank You

I want to invite and welcome all of you to check out http://www.thetubecenter.com.
We are a leading vacuum tube supplier with over 3.5 million tubes in
our warehouse. We carry all major manufacturers and brands and unless
otherwise noted all of our tubes are NOS/NIB.

P.S. The people here are GREAT! and I'm not just saying that because
I'm one of them.

Thank You

```

Sounds like hog wash. No blue or blue in tubes is probably normal.
Magenta is probably gas.

Sounds like hog wash. No blue or blue in tubes is probably
normal.
Magenta is probably gas.

Its very common to see a blue glow on the envelope when there is fairly high voltage on the tube. I've forgotten the mechanism but its not gas. Gas can cause a glow between elements.

AFAIK, there is no way to re-flash the getter.

Usually take as the tube has gone soft , slight air leak over the
years ? soft vlave =3D soft vac , slight residual gas .. so  assume
'gone' soft taken as loss of vac ?.. or may be impurity's in the
metal  have boiled out due to  over heating ?

G ..

Two comments.
1) I do recall certain 807s in the intermediate stages of a WWII
transmitter that exhibited blue fluorescence of the glass envelope due
in IMO to electrons missing the plate/anode and striking the glass.
Say this because one could see a definite pattern of the electrode
structure in the fluorescence of the glass, rather like sunlight
shining through a patterned window onto a wall or floor. It was not
just a 'fuzzy' indistinct glow! These 807s were fine and worked
perfectly as drivers and modulators to the final/PA.
A 'soft' or 'gassy' tube on the other hand would have a glow inside
its electrode structure; rather similar to a gas voltage regulator
tube; such as an OD3 VR150 etc.
2) It MIGHT be possible to get rid of gas in a tube by reheating the
getter; there might be active 'getting' material left? No expert on
tube manufacture but understand those getters were heated by RF. So
could be done again?
Whether the gas has leaked in over the years or is residual gas from
original rushed manufacture during say war time conditions might also
be a factor? If air leaks into the tube albeit slowly over many years
it may continue to do so? Although using the tube (i.e. hot) may
discourage (slow down) or encourage (hasten) that?
002 from here.
Newfoundland; where in Dec. 1901 Marconi received the first
Transatlantic wireless telegraph message!

You can heat them again, but it will be to no good purpose. The getter is a tray filled with a getter metal, such as barium. The tray is usually in the shape of a loop so that it is easy to induce RF current into the loop and heat it very hot. The metal all evaporates and deposits on the cool glass (usually) It is very unlikely that there is anything left over.

Where would be the best place to list a Collins KWS-1 / 75A-4 pair and
LK800ism (general coverage TNY) amp? I havn't been active in years and
have somewhat lost touch with the market...

Thanks,
Sean

Thanks. That is what I thought as they were found in an AK20 that had one 201a in it along with these R221's. Physically the R221's are different looking than the 01a's as they have a double filament like a 071a has. The filaments also burn much redder than the 01a filaments.

If you're ever interested in getting rid of any of them
I'd sure like to have a R221 for my tube collection.

If they were mine, and the AK20 was used very much, I'd swap them out
for regular 201A's. I bet their 0.6A filament's life is a lot shorter
than the regular .25A ones...

But what do I know? :)

I repaired an HQ-145 that I picked up for a song. There was a bad RF choke
in it.
Anyway I decided not to touch the caps- why fix it if it aint broke and like
Colin I have a long list of radios to repair or build. It is one of the few
times I have never replaced the old PS caps in a restoration job.

I did not touch any discs, although I do replace all wax caps. I was
surprised that a spot check of resistors showed them all right on the money

Anyway 2 weeks after I get it all buttoned up the PS caps went. no damage
just a nice loud hum

ARRRGGH

Do like the radio

Did you reform the electrolytic capacitors before you ran it for the 2 weeks,
or did you just plug it in and turn it on?

Hello, and thanks to all of you guys who helped with suggestions and
answers. I am having a friend recap the radio, put new caps in the
power supply, re-align and totally clean it up. Also, to Pete, he is
installing a fuse for the chassis! Looking forward to getting back
next week and plugging it in and actually working!
Thanks,
Bob

Great news, and a happy ending. Let us know how you like
the radio when you get it back. I need some incentive to dig
mine out and align it.

Pete

thanks for your help. I found the documentation the previous owner
did, and he used half of a 6sn7 in replacement of the 6j5 bfo tube and
labeled it an "inf. imp. detector. what would be the advantage of
doing this?
Also, Johns sx-28 restoration (and others) are the most incredible
restorations i have ever seen documented. Thanks for the links!
I've got a working sx-28 on loan to help in comparing/restoring mine.

The original detector in the SX-28 was what is known as a "plate-detector". They have an advantage in short-wave radios in that they provide a lower load to the final IF transformer, and only minimally affect the Q, and hence the bandwidth. The stage stays sharper, improving adjacent signal rejection.

Plate detectors are nasty things because they introduce high distortion both on low amplitude signals, and on high modulation signals. They are suitable for shortwave voice quality signals, but terrible for music.

The so-called "infinite-impedance" detector, also known as a "reflex-detector" attempts to correct the problems of the plate-detector by adding some gain, and negative feedback. The added gain even further reduces the loading of the detector on the final IF stage, and the negative feedback improves the linearity of the rectification function that does the demodulation of the AM signal. In other words, it improves the distortion on both the low and high volume signals.

The original owner must have been offended by the poor audio quality of the SX-28, and wanted to listen to his short-wave music broadcasts in high-fidelity.

-Chuck

Friend asked me to post this - he is looking for this small linear
amplifier - no wrecks. With or without PS is ok.

Thanks.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday June 15th 2008
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take place on the third Sunday of each month this summer, April thru October.

There is tailgate space for over 600 sellers and free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if you're lucky enough to have a copy of our ad) and sellers spaces are $20 for the first and $15 for each additional at the gate.

The flea will be held on Albany between Mass Ave and Main streets in Cambridge; right in the Kendall Square area from 9AM to 2PM, with sellers set-up time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776 (M-F 9-5)

********** $1 buyers discount with hard copy of this notice ************

<FF>

Mail the coupon below by the 5th to be a Prepaid Vendor.

FLEA at MIT 2008 Rates

SELLERS

To use your prepaid spaces the named vendor MUST be present.
Rates include one admission per space.

Season Pass Sellers admission to all seven meets this year
$99 First Space
$70 Each Additional space
Must be received by April 20th.

Advance $17 First space
$12 Additional Spaces
Must be received by the 10th of the month.

Gate Admission $20 First Space
$15 Additional Spaces
Admission is after the prepaid vendors.

```
Early Bird Buyer -Admission after the prepaid vendor line is admitted. ~ 7:15AM
                ** You may not sell. **
                $15 per person at the gate.
                $70 Season Early Bird Buyer

> RECAP YOUR HQ-145 - even if it only has the one can.

Amen. I don't know why so many people are too lazy -- or is it just too
stubborn -- to replace those ancient electrolytics.

After you have burned up an expensive and/or "unobtanium" power transformer,
you'll see what I'm talking about.

Been there, done that :-(

Turning the radio on without reforming the cap is indeed laziness.

Bringing the radio up slowly with a variac, is less lazy, but still
fraught with problems... most folks won't go as slowly as you really
need to go (about 8 hours from 50% to 100% power with a close eye on
input current.) for success.

But if you can reform the cap (and if you do it out of circuit with
a current limiting resistor it is obvious when you are successful),
it will be just as good as when it was new.

New multi-section electrolytic capacitors are not always available today.
Some values exist because of the guitar-amp crowd, but in general they
are more purely unobtainium than power transformers (check out Hammond).

Why replace it if it reforms ok?

-Chuck

My long awaited HE-30 arrived today, smashed by
UPS (exceptionally poor packing.) So, hopefully
someone out there has a parts unit available (need
a good front panel, and some knobs.. etc.) If you
have one, let me know.

Peter radioconnection(at)juno(dot)com

I sold this to someone overseas. Going from UK to Malta.

How do I send this? Do I put all the units on a pallet and cover up, or
what?

Net Weight of units: 342Lbs, 155Kgs.

Tips appreciated. Thanks.

No matter if its here or over your way, I'd certainly go to an Int'l.
freight forwarder. They can provide the exit and entry handling and
paperwork, which may be extensive. Hopefully, your buyer has the
wherewith all to have the equipment properly prepared for the trip.
Here in the US, we have some country-specific carriers that have a
pipe-line to their respective overseas locations. I, of course, don't
know what the UK's position is with Malta, these days. Do you have any
military equipment transfer requirements? Can you, in fact, ship
military hardware, albeit vintage, to Malta or does it require a Govt.
approval? Again though, looking at your nice equipment, it deserves
professional crating and bracing for the trip, at a minimum.

He's sold it to Malta, that's in the EC and so it shouldn't need any special paperwork. We don't (yet) have the daft restrictions on old military gear that you have in the US, although no doubt someone in Whitehall is thinking some up as we speak. Mustn't say too much or I'll get banged-up for 42 days without the option!

Richard, have you thought of splitting it into separate items and using someone like Parcel2Go? They block-book shipping space with outfits like DHL and don't seem too hung-up on weights like the Royal Mail, they may also give you a discount on several items to the same address. Worth a try, I use them quite often.

Well if you do 'that' the pallet might reach malta .... afraid its going to be nearly as much to post it as the winning bid ... depends on the buyer , but looks like it will need a crate making and the internals secured for transit , malta is in the common market , so no tax problems , this kind of kit is moved round by the forces in 'special transit cases' wooded boxes with internal reinforcing ribs and retaining bolts ... which are allways marked ' do not scrap return to stores'

ring round for quotes ?

Next time make it buyer collects!!!!!!!!!!!!!!!!!!!!!

As others have said you will really need some good strong crates. Maybe
give Anchor in Nottingham a call and see if they have any.

Hi Dick,

These are the skirted ones with the H in the center, right? Larry Bordonaro makes reproductions. I bought a couple for my SX-23. The only problem with them is that they do not have the metal inserts. The two setscrews in each knob are threaded into the plastic.I had to file flat spots on my shafts to get them to work. I would think that for heavy use, these would need to be modified. They look great though.

Larrys web site is at www.antiqueradioknobs.com . His email is available on the web site. Although he does not list these knobs on his site, he has the mold and will make them for you.

I need a Bandswitch knob and a Main Tuning knob.
Anyone have any of these or know of a source of
reproductions ?

Thanks, Dick, W1KSZ

Doesn't that have something to do with older tubes being 'bright emitters'?

Later, thoriated tungsten cathodes were introduced that could produce sufficient electrons with lower cathode heater current?

No, bright emitters were 1 amp filament tubes.
It took a good battery to run a set full of those.

Does anyone happens to have a 5,200 crystal filter for Hallicrafters SR-160 or SR-500? Or one of such radios for parts?

73

Tony I0JX

Hi,

I have just picked up the base station version of the Micom-1, RX appears fine but the TX is not so happy. It produces RF but does not have a lot of audio, seems as though it is trying to transmit with inserted carrier, but with minimal AF. So I am assuming that something in the modulator, balanced mixed is unwell. I have an owners manual for the Rapid Deployment version,
http://www.radiomilitari.com/micom1.html
I have this unit too so have an idea of programming and I don't think it is that. So does any one have any pointers they could give me? A circuit would be handy!

Website:http://www.mobicoverter.com/

3GP/mobile/iPod/PSP Converter convert your VCD, DVD and AVI(DivX, MS MPEG4, uncompressed, etc), MPEG-1, MPEG-2 (PAL, NTSC), MOV, WMV, FLV and MP4 video files to 3GP, 3GP2 and MP4 files without knowing any technical jargon(such as Bitrate, Sample Rate, Frame Rate, etc) at all! So then you can transfer to your Cell phone, PSP and iPod, and enjoy them Anytime, Everywhere!

And we have provided dozens of codec profiles for most popular cell phone, such as Sony Ericsson, Nokia, Motorola, Samsung, LG, Simense, Pansonic, Sanyo, NEC and so on. What you have to do is simply launch the software, and pick up your model!

I had one of these amps, new when they first came out.
Drove it with a Drake T-4XC, the amp put out Scary power, very
easily:-)
After that I was careful of the drive power.
GL......

I recently acquired a Collins 310B-1 that I would like to put on the air.
After repairing the AC input circuitry (blown feedthrough cap, etc.) and
replacing the elecrolytics, I found the power output was well below the
rated 15 Watts so I started looking at the signal chain.

What should the level of the baseband signal coming from the 70E-8A PTO?

Measured at the grid of the 6AG7 first buffer multiplier, mine is only 4V pk-pk. That is not enough to run the multiplier class C because the cathode resistor develops 12V when the 310B is keyed. On 80 meters, I get 40V pk-pk out of the buffer multiplier measured at the grid of the 2E26 power amp giving a multiplier gain of about 10. Since the power amp has a grid bias of -60V, the drive level isn't sufficient to operate the amp class C either, and there's no grid current for tuning the buffer stage.

I haven't yet measured the value of the 1.5K cathode resistor of the buffer multiplier, so I don't know if it has increased in value.

Thanks in advance for your help.
Bob AD3K

Bob,
I think someone was having a bad day...maybe
a pile of radios fell of the bench onto his foot.  ;-)

The only danger of not replacing the filter caps is that
it'll short and fry your power transformer. Add an appropriate
size fuse, which is a good idea for any old radio anyway.
Replace the filter when it finally dies.
Thats what I usually do unless its a high end radio.
                                 Steve

Sometimes yes but often times, no. In certain circuits, a capacitor failure may precipitate another component failure that is either difficult or impossible to find, e.g.: IF cans and power transformers. Oft times its far better to apply some preventative maintenance than to wait for an inevitable, and perhaps catastrophic, failure.

From the estate of Tom W1JC, is his Kenwood TL-922A Amplifier. Used daily up until he took ill in March.

No shipping. Will deliver within 50 miles of Hartford CT. No manual, we're looking for it, but one is available for free download from the BAMA site. Excellent condition.

$700

Bob W1CNY

Truly.

Is there any one of us that hasn't noticed that collecting old radios is an
insatiable hunger. We are always trying to re-find the excitement we got when
we found the first gem we longed for... But alas, you can be a virgin only once.

-Chuck

I'd power it up on a variac, and if it powers up properly and the supply
voltages are okay, I'd leave it.

If the supply voltages are NOT okay, I'd change the supply caps immediately
before you ruin the power transformer.

His advice was good: get a lot more old beat-up radios and then you will
not have time to worry about minor issues like the possibility of bad
supply caps in an HQ-145.

Not at all. There is your first ARC-5 set, your first GRR-9, your first
Racal.

Hell, every time I open up the R-390 and look inside, I feel like someone
has just taken my virginity...

I have a great sense of humor at the appropriate time, not when asking
a question and getting the old "USENET" rant.  I expected more out of
him, and I was wrong.

In my experience, old electrolytic capacitors seldom get shorted; they rather
become an open circuit. But when this occurs, you will hear hum in the speaker.

In Italy there is an old saying that I'll try to translate in English (wow, I
was even able to preserve the rhyme):

"if it works and does not go off the rails
do not touch or it surely fails"

As to the issue whether the other capacitors are all ceramic, I am sorry I
cannot help you as I do not know the HQ-145. But I spare you another silly
answer in addition to the many you have already received.

> Thanks,

Of course, there were never many electrolytic capacitors in tube equipment. In the power supply, and bypassing the cathodes of the audio stages, and maybe at some point to bypass the B+ line close to the audio output stage.

They weren't common because they weren't needed. Since tubes are high impedance, large value capacitors weren't needed much, and hence no shift to electrolytics.

Solid state equipment uses a whole lot more electrolytics because of their low impedance operation, so you need large value capacitors for coupling and bypassing. Electrolytics are the only reasonable way to get those larger values.

All the talk of recapping old radios is basically due to old capacitors. Badly designed capacitors at the time, or simply the best at the time, end up aging badly. The capacitors were fine at the time, it's just few gave much thought to the equipment being used decades past their prime. So decades later, those low value capacitors often need replacing because they just don't work properly nowadays. So you get bad bypassing at RF, and you get weak or non-existent audio because the coupling capacitors have gone.

Replacing an electrolytic in the power supply is hardly "recapping", it's repair. "Recapping" is when someone feels they should replace all the capacitors, or actually needs to replace a specific capacitor. And then once you've done one, it often makes sense to do the whole lot, especially if it requires a complicated disassembly. IN some cases capacitors known to go bad over the decades were used, so it's worth replacing all of them because they will go bad eventually, or enough have gone bad that it's hard to get a handle on where the exact problem lies, and replacing the capacitors gets that variable out of the way.

Thank you Tony, that is my brother's name BTW, for your answer. I
appreciate courtesy as I try to give it to others when they ask for my
opinion.

Michael, thank you for the very informative and detailed answer. I
always thought the opposite, that older radios had many capacitors
that needed replacement, my little S-38 had about 10 that had to be
replaced! My Lafayette HE-10, not so many.
Again, thank you for the courteous and very helpful answer.

"Count Floyd" <CountFloyd@MonsterChillerHorrorTheater.com> wrote in message news:BJ4mQCBKg9HM-pn2-kdlcYKcmzOkn@localhost...

Count..

Whatever you do, please consider fusing that chassis! The HQ-145 has no line fuse, and that is a must to protect the power transformer!

The electrolytic is your call, chances are it will be okay, or it may fail open. But, if fails shorted, you will likely lose the rectifier tube in the process, and maybe the transformer if the fuse isn't quick enough.

By the way, the biggest problem in my HQ-145 was internal shorts in a few of the IF transformers. A few of the fixed mica caps developed leakage paths to the transformer shells, shorted to ground, took a few resistors, and caused a big restoration headache since the plastic coils fell apart when touched :(

Pete

Pete,
That sounds like a real horror story! How do I fuse the chassis or put in and inline fuse. As electrical work goes, I depend on some older hams who know how to solder. I hope that this HQ-145 is in good shape, the gentleman who is giving it to me says it plays well, no problems. I hope that there are not the problems that you described!

In your original post, you claimed:

"If the radio is working well as original, would it be
better to just leave well enough alone? I always try to live by the
maxim: If it ain't broke....."

My light hearted reply was simply trying to justify your continuing to follow the maxim you claimed to live by.

Moreover, a prior post you made requested information on someone who could recap the HQ-145. That implied that you were not able to do the work yourself. So, my post gave you a reason to save your money or save you from attempting to do something you were not able to do.

And, if you did not have a chip on your shoulder, you would have noted that my reply contained a bit of envy that you could be worried about such rather trivial matters. Most real boatanchor collectors can barely stay above water with things that they consider more pressing. We inherit broken radios and some literally show up at our door. Others, we feel sorry for when we see them at a swap meet under a table.

The fact is that you were worrying about the wrong components. Ceramic capacitors are going to be closer to specified tlerance than the carbon composition resistors. So, if you are going to change out all the ceramic capacitors, you will want to change out all the carbon composition resistors. Seems like a lot of work for an HQ-145.

If your feelings were hurt, it was not intended.

Colin K7FM

Count

Have the gent who is working on the radio add a fuse
in series with the off/on switch on the AC line.
A 1 amp fuse should do it.

My HQ145 had the IF problem when it was given to
me. I suspect only a few ever have the problem. But,
that's why mine was "free" when I got it! If yours
plays, it is probably okay.

Pete

Fully agreed.

However the bare minumum one should do is to replace the paper capacitors
located on the high impedance points", that is the plate-to grid coupling
capacitors and those on the AGC line.

In my experience main problem of old paper caqpacitors is not the loss of
by-passing properties, but the birth of a non-negligible reeistance (1 to
several Mohms) in parallel with capacitance. In some cases such resistance does
not create problems (e.g. screen bypassing), but it does when the capacitor is
placed on a high impedance points.

No paper caps in an HQ-145. That is supposed to make life easy.

Any receiver should be fused with the appropriate fuse, since even with new electrolytics, the rectifier can short out.

How could you possibly interpret that as a rant? I was laughing all the way
though it.
I've seen the movie Colin, and only recently have I been able to slow down
on purchases....although an NCX-5 is looking more and more interesting.

I just received the radio, brought up the power, played well for about five minutes, then the hum started, a noise like sizzling bacon, a faint burning odor, then I shut off power immediately. Is it the electrolytic capacitors, the rectifier, both? Any suggestions would

help.
Thanks,
Bob Grimes

That is typical of an electrolytic capacitor that desperately needed for
you to spend a couple minutes of effort reforming it.

This is the one case where electrolytic capacitors fail shorted. The oxide layer is too thin, and it arcs over, creating an electrolyte bridge between the plates of the capacitor. All of the current goes into heating the electrolyte, causing it to boil, and given time, spew forth from any weak spot in the capacitor's case.

In spite of what a lot of the guys will tell you, bringing up the capacitors on a variac doesn't help all that much. It's better than doing nothing, but will still kill capacitors that could have been reformed. The reason this is so, is when the capacitor is reforming, it inevitably creates little short circuits. The variac doesn't limit the current, so when one of these little shorts occur, it damages the aluminum foil.

A better way, with a tube radio, is to charge the capacitor up to operating voltage
using a bench power supply with a series resistor (2K, 5W). Because the tubes aren't lit, there is little else in the circuit that will draw current while you do this.

The capacitor, the rectifier tube, and possibly the transformer are
the likely collateral damage.

-Chuck

It's probably one of the three electrolytics in the can. Two are the power supply filters, and the small value goes to the 6AQ5 audio amp. I got a literal smoke test when I tested my HQ-145 and I saw the smoke coming from the rectifier. I just recapped those three and the receiver works fine now. The values in the can are not standard values today, so I used a 47 and 60 mircro farad, 450 volt. I was able to get the same value for the 50 volt audio electrolytic. Recapping was a one week project to order and receive the caps and about 30 minutes to install them. I also got a four or five post terminal soldering strip, one of them grounded to place the caps. An ambitious person could try to stuff the caps into the metal can in a rebuild, but that is a bit too much authenticity for me. These 45 year old caps do dry out. It might be possible to reform them with a Variac brought up slowly, but I've never tried it. This is not a '64 Mustang convertable or an ancient Corvette. My view is that even when new, non-orignal parts were substituted in any routine repair.

Just remember to replace any jumpers on the relay outlet on the back panel. The radio doesn't work without it. You either need the jumper or a contact on a relay as I discovered in a very frustrating trouble shooting session. Duh!

HAMPDEN COUNTY RADIO ASSOCIATION:

ANNUAL TAIL GATE PARTY

Date: June 6, 2008
Time: Set-up starts at 5:00 PM
Place: Feeding Hills Congregational Church, 21 North Westfield St, Feeding Hills, MA 01030

Buyers: $5 a space
Sellers: FREE !!!

The weather promises to be good (once again) for our annual tail gate party. Set-up starts at 5:00 PM and the buyers usually show up very soon afterward. There is plenty of space in the paved parking lot for vendors and buyers alike. The club will also accept donations for the 'club table' as appropriate.

In addition to the tail gate affair the raffle this month is a Yaesu VX170 HT. Tickets for this 5 watt handi talkie are only $1 (book of 6 for $5). Coffee, soft drinks and donuts are also available.

This is open to the public. Membership in HCRA is not necessary and we hope anyone interested will attend. Bring a friend, the more the merrier. Remember there is no entry fee for buyers.

Read more about the Tail Gate Party and our club at: http://www.hcra.org

'73 and see you Friday,

Jim, KK1W

Novel idea. The buyers buy the space, and the sellers
run the goods around in wheelbarrows to each
prospective buyer.

Works for me.

Bob, why did you do that :(

Electrolytics should have been changed, and fuse the
AC! A faint burning odor the is transformer overheating.

Pedro

Its easy enough to check the transformer. Remove the rectifier and measure the AC voltage at the socket where the plate pins connect. Actually, if the tranformer has shorted it will probably make noise just having AC on it. Electrolytic caps often have a strong ammonia-like odor when the go short and often vent electrolyte. If yours have done this clean the stuff off whatever its gotten on because it can be corrosive.

One other idea. The burnt smell could be a resistor, and
might be the result of a failed component. My HQ-145
had a burnt resistor which was caused by the IF transformer
failure. Have examined the chassis to see if there are any
burnt parts?

Pete

Pete,
Have not checked, I am trying to find someone in my area to recap and
fix the radio as it is really beautiful shape, all knobs, no
scratches, really great looks! I wish that I had the knowledge to fix
the radio.
Bob

I'm sorry to hear you're having those problems :(
I hope it is a simple fix, good luck with it. Mine is
in a closet waiting to be gone through.

Hello Bob:

I see that you are unfamiliar with servicing radios. Many of us have taught ourselves - I know I did. Working on an old radio is straightforward and logical. There are many books out there that cover most of what you need to know. Then, it just comes to common sense and deductive reasoning.

Manuals for most radios are available for free on the internet, and together with an old Radio Amateur Handbook you can pick up everything you need.

Basic test equipment includes a digital voltmeter that can be purchased for a few dollars. A $25 grid dip meter can serve as a signal source. Gradually, you can pick up a few items which make servicing much easier. However, most of us started with minimum equipment.

The older servicing books from the late 30s and 40s are ideal because they assume they tell you how to make your own equipment. As a matter of fact, if you need to test a tube, you can build a tube tester from scratch in just a few minutes. It will have wires going all over, but you will be able to make simple tests.

With all the new test equipment becoming surplus, you can often pick up some older equipment for nothing, or very close to it. Old Tektronix scopes are often available for hauling away. Likewise older tube signal generators.

The beauty of the older radios is that they all work pretty much the same. A Hammarlund HQ-120, sold before WW II, is the same basic radio as your HQ-145. Learning to service one will give you all you need to know to service the other. That is far different than the radios today.

As others have mentioned, you can remove the 5U4 and that should remove the overload on the power transformer. If the radio does not hum or smoke after the 5U4 is pulled, then the transformer is fine and a simple replacement of the filter caps will probably get you back into business. And, as others have mentioned, a fuse would be very helpful to prevent a catastrophe in the event of a short.

Colin K7FM

Does anyone have a datasheet or tube information on a Northern Electric R221-DX Tube? This doesn't appear in any of the usual (RCA) tube manuals. This tube appears was manufactured in Canada in the mid

1920s.

Charles...

Excellent webpage showing full construction
details and loaded with ideas for refurbishing
towers and building remote-controlled tuners.
Also liked the details on the Honda CBX. Often
wondered what happened to that model.

I Googled the number and came up with a page in Japanese, which is translated here:

<http://translate.google.com/translate?hl=en&sl=ja&u=http://homepage.mac.com/ryomasuda/VT/num/221/index.html>

It's a type 201 variant. Click on the "201C" link for a chart.

Bob,

Take it from someone WHO KNOWS...

RECAP YOUR HQ-145 - even if it only has the one can.

I carelessly took the lazy way out on a similar piece. If and when the cap finally shorts you may not even have enough time to jump from the chair to grab the power cord out from the wall before the transformer is fried to a crisp.

It's awfully cheap insurance. And, by the way...make sure you fuse the HQ-145 BUT DON'T DEPEND ON IT FOR PROTECTION. Mine was fused, too and the fuse didn't pop until the moment that I removed the plug from the wall.Fusing only ensures that power will be removed eventually...NOT that the transformer will be protected from total damage.

Smokey

This cable is used for adjustment of the Counter (DG-1). It goes from the X-Verter In jack to the three pin connector at the top of the counter unit. It is only used during alignment of the display counter.

It looks easy enough to construct, but I need to know where the connections are made to that three pin connector.

I assume there are only two connections -- the shield and the center of the cord coming from the X-Verter jack.

I don't have a good copy of the service or users manuals so it's difficult for me to tell.

Thanks in advance for any assistance,

Irv VE6BP

Ben -

Bill Orr' Radio Handbooks use to have an artcile and schematic for using a 6SN7 as a product detector in 1950s and 1960s vintage receivers (that use simple diode detectors).

Additional SX-28 resources (amny with photos)

The later Radio Handbooks had the same detector, but they used a 12AU7
instead of the 6SN7.

Don't assume that the person doing the modification did not know what
he was doing. Adding a product detector is generally a great improvement
for a radio that is used for CW or SSB reception.

What I would do, is trace out a schematic for the area around the 6SN7,
and see what was done. It might be a great improvement to a mediocre
(by todays standards) receiver.

Authoritative answer: "It depends." <grin>

A single telegraph line could have multiple stations on it, with 'common' wiring -- anything from one station on the line was echoed at _all_ the other stations -- more-or-less broadcast.

A given 'line' spanned a relatively limited distance, so 'long-haul' messages went through relay/distribution centers between origin and final destination. These were 'store-and-forward' facilities, rather than 'repeaters'. i.e., the operator on one line received the message, copying to paper, and passed to the operator on the other line for re-transmission. Late versions of the system replaced the 'relay' operators with electromechanical devices. (And *NOW* you know where the name for those solenoid switches comes from :)

By the time the telegraph network was widespread, the "long distance" lines were (_almost_ exclusively) only 2 stations -- enough traffic flowing end-to-end (and beyond) that there was no net benefit to additional drops on the line.

The 'edges' of the network -- mostly small-time rural America -- were another story. 40 miles was a full days ride on horseback. If you were 10 miles out of town, getting to/from town was a _half-day_. Outposts of civilization, thus tended to be as close as 15-25 miles --- in the mountains, even closer. Several stations, "party-lined", on a single 'line' were common. I'm not aware of any commercial line where the station count was out of the single digits, but I'm no expert on the matter. <grin> Mine telegraphs could have *lots* of stations on the same 'paralleled' line, as various levels were worked out, and additional horizontal bores were run.

Where you had several stations on a single line, there was a code for each station on that line -- a multiple-duties operator could ignore an 'alert' that was -not- prefixed with his code. If it was addressed to him, he'd key a 'go ahead' when he was ready to receive.

The most common wiring set-up was straight series -- in each station, the key and sounder were in series, and the stations were in series with each other. This only needed one overhead wire, with an 'earth' ground return. One disadvantage was that each key required a shorting switch when not in use. Failure to short the key resulted in an 'open' circuit, with no messaging possible until the key was closed. Same problem if any of the sounders failed 'open'.

This was, obviously, a voltage-driven configuration -- more stations 'on line' required higher driving voltage to ensure that the voltage drop across each sounder was sufficient for operation.

There was another set-up used, primarily for shorter distances, and where stations were only intermittently installed/manned -- seasonal stations, or 'in-mine' wiring, for example. This was multiple wires 'in parallel', with a simple T-tap wherever a station was needed. First wire was the 'battery' supply, and was tapped to feed one side of the key. Other side of the key went back to the second wire. The sounder was wired between the 2nd wire and 'ground' (sometimes a 3rd wire, sometimes 'earth').

Had the advantage of -not- requiring a shorting switch on the key, better for the 'occasional' operator. AND a failed sounder did not disable the other stations.

Had the disadvantage of requiring 2-3 times the wire of the series setup.

This configuration is current-driven -- a constant voltage requirement -- but the current running through each key (when closed) has to drive all the sounders.

I=92m just about finished refurbishing a Heathkit SB-401 amateur
transmitter that has, according to the manual=92s parts list, five 0.2uF
=93resin=94 capacitors. What are these things and how reliable are they?
Does conventional wisdom dictate that such caps should be replaced?

I=92ve searched the web for information on this, but only get hits
concerning Black Beauty caps, which most always need to be replaced.

They are called "resin-dipped" because of the outer casing. You don't really
care about the outer casing, you care about what is inside. If the dielectric
is plastic, keep it. If it's paper, replace it.

>I=92ve searched the web for information on this, but only get hits
>concerning Black Beauty caps, which most always need to be replaced.

Where are the caps and what will happen if they fail? In a receiver IF,
a bad cap can take out an IF transformer, but if it's just driving another
tube stage, the consequences of failure are minimal.

They're bulbous, and look very much like the contemporary orange drop
capacitor we all know and love.

Three are used in the detector for the automatic level control (ALC)
circuit.  Failure here probably wouldn=92t be catastrophic.  Another
provides bypass in the output driver grid circuit, but is shunted by
some large resistors.  I doubt failure would do much here either.  The
last one provides bypass on the filament voltage to the linear master
oscillator (LMO).  In this case, failure as a short could stress the
power transformer.

This just looks like a simple BFO... I do not see any filter or detector
here.  Useful enough, but not so high-performance.

I'm not so sure paper dielectric caps are automatically so bad. The key is to measure the cap, see if the capacity is near what its supposed to be and if its lossy.

The casing can have an effect. For instance, the notorious Black Beauty caps are often found with cracks or even bits of the case cracked off. These have exactly the same dielectric and construction as the Orange Drop caps, namely paper impregnated with a plastic, the difference is that the BBs are molded resin, not sure of what it is, and the ODs are dipped Epoxy. OD's are pretty reliable where at least early BBs are trouble. I think the problem with the BBs has to do with moisture leaking into the body of the cap but also the winding in the ones I've dissected were distorted, perhaps by shrinkage. Curiously, BBs were sold originally as deluxe capacitors for long life and operation over an extended temperature range.

Old waxed paper caps should be checked but I've found plenty which were still good. In general, where a paper cap is used well under its maximum voltage rating it will have long life.

The effect of a decoupling cap going bad may be to cause feedback or to short the power to the element. They are almost always used with a resistor to form an RC filter. I don't see how a bad decoupling cap could take out an IF transformer because its ahead of the transformer and will not draw current through it. A bad coupling cap can put bias onto the following tube grid (or transistor) causing high distortion or other problems. Where an audio amp has unusually high distortion coupling caps are always at the top of the list of suspects. Coupling caps should have the lowest leakage obtainable.

I would check the suspect caps with a bridge, or even just with an ohm meter, to see if they should be replaced. If they are not bad just leave them alone.

What is even neater is if it would be possible to make the
entire phasing using passive components. (I suppose it is,
but it would have excessive losses?) In one direction
it would demodulate only one sideband; while feeding audio
back into would in turn generate an SSB signal. IIRC, the
math shows the sidebands would be "reversed" between RX
and TX functions, however...

Sorry but I thought it was a mediocre radio. When you open it up you
as yourself "What did they do with the other half of the radio"? You
would be much better off with one of their older pre miniature tube
radios such as the HQ0150,140 or 120. Of the more modern radios the
HQ-110 was not too bad though.

Tony

Three are used in the detector for the automatic level control (ALC) circuit. Failure here probably wouldn�t be catastrophic. Another provides bypass in the output driver grid circuit, but is shunted by some large resistors. I doubt failure would do much here either. The last one provides bypass on the filament voltage to the linear master oscillator (LMO). In this case, failure as a short could stress the power transformer.

-Dave, K3WQ

The leakage may only show when the cap is subjected to full rated voltage. Chances are they will work in filament and cathode bypass applications without much issue. They rarely go into a zero ohm failure mode.

If it is part of the time constant for the ALC circuit, leakage could cause big problems. What grid is it bypassing in the driver stage--screen or control?

If they are mylar or polyester dielectric they are probably okay. New caps are pretty cheap, however.

Pete

I am working over a Navy RBM receiver (the HF version) that I got at a swap meet some years ago. It has zero value as a collector's item as some previous owner (perhaps even the U.S. Gov.) was nice enough to remove all the nameplates except the list of patents! I have the manual for the "RBM, RBM1, RBM2 and RBM3" and this has all the necessary diagrams, part lists and alignment info. It does not, however, give any indication of how the different versions (1, 2, 3 and higher) differed. Can anyone give me a brief overview on this question? My version, if this is worth anything, has the big letters on the dials ("T" for tune, "B" for band, etc. I'm trying to figure out what version this is ....

I should have mentioned in my query on the RBM -- this set has a stamped fungicide treatment date of 26 Nov 1945 .... in case this is any clue as to "version".

Jim, Do you subscribe to Electric Radio magazine? There's an article in a back issue that I did a few years ago that describes the various RBM and RBS variants. I'll try and locate my original manuscripts and/or scan the pages. It may help you do an ident. BTW, does the receiver have large lettering on 4 knob faces on the front panel? If so, its an RBS, vice an RBM.

That is correct. When I recapped mine, I just had to replace the three capacitors inside a multi-capacitor can. Two of them were ca. 500 volts in the 40-60 mfd range and were the filter capacitors. In the same can was a 50 volt capacitor, I think 10 or 20 mfd which was part of the audio circuit to the 6AQ5. I just replaced them with discrete components. Everything else I could find were disk ceramics.
After I recapped, I couldn't get the thing to work and was somewhat frustrated by this as all the voltages etc checked out and I had done all the tube substitution. What I forgot was that when I took it out of its case I removed a jumper between the prongs of the relay output. You either need a jumper, or and actual send/receive relay contacts or it won't work.
Duh. I discovered this when I got the schematic for the version I actually had. There was a small modification in mid production when Hammarlund changed from a tube rectifier (5U4 family) to diodes and I had a schematic of a later version than the one I had. I the schematic (got off of BAMA or some website like that) there was some text which said you had to have the jumper (or relay) or the radio wouldn't work. I don't remember what the relay controled, it might have lifted the center tap of the power transformer. I'll have to look at the schematic again. Recapping was about a 30 minute job, mostly just figuring out where to mount the caps. I added a 4 our 5 tab terminal strip with one of the tabs going to chassis ground.

I haven't used the radio at all really. I got it in a rather funny way about 12 years ago. I went to buy a Heath SB-200 amp that a ham was selling on behalf of the estate of a Silent Key. I was trying to negotiate the price downward a bit in the spirit of ham horse trading. So the fellow agreed to my price which was about $50.00 under the asking price. He agreed to the lower price by said "But if I give you that price, you're going to have to take this old receiver off of my hands and he gave it to me. The few times I have had an antenna on it, it seemed to work fine, but my memory of how old tube radios work is a bit dim and these old radios don't have the bells and whistles of the modern ICOM equipment I have in my actual working shack. A crystal filter is no match for modern filters of DSP.

Unfortunately I don't have much of a junk box now to throw together a simple CW transmitter, something I did fairly often when I was a kid (I was licensed at age 13, I'm now 66.) Maybe I'll have to get into this as I am leaving another hobby...sailing. My boat was just sunk by two huge oak trees falling on it while at a dock.

HALLO GOOD Morning to All

TR4-C   IN RX MODE

When I'am go   with the switch , from SSB

to X-CW or X-AM of TR4-C the indicator S-Meter and

Plate Ampers go to full scale and not return to 0,

I'am to be put the TR4-c in Power Off and workoff any minutes and

Power-on the indicator remain normaly to 0.

Or to put the TR4-c in x-CW or x-AM , I'am Power-ON is all OK.

The Problem is when the indicator is POWER-ON and I'm switch from

ssb to x-cw or x-am .

I have observed that the Relays (k1 of circuit of tube 6ev7) it does
not return in Position of relax , but remains excited.

Help Me

Thank You

Frank

The HQ-140 and HQ-150 were miniature tube radios. They were pretty much the same circuit - except that the HQ-145 was dual conversion on the upper band, which gave it better image rejection.

This is where the subjective part comes in, as I was not impressed with the HQ-110. It did not have a crystal filter and did not have the ultimate selectivity of the other receivers. Sure it had a crappy Q multiplier, but that only gave "nose" selectivity and no "skirt" selectivity. It was more compact and looked nice. But, I was over at my friend's house when he brought home a Drake 2B to try next to it. The HQ-110 left the house the next day and was traded in on the 2B.

Life was simple in those days.

I just reviewed the 1845 Telegraphers Handbook. I suspect that telegraphers were the first to use acronyms, since they charged by the word and could increase the amount of coins in their pocket by shortening words. Most of the acronyms or abbreviations were recognized, but one that caught me by surprise was "Pascoela = Natives have plundered everything from the wreck". Not too sure it would be useful today. I am guessing Pascoela is an acronym from another language.

That's not an acronym or abbreviation but a code, intended to hide the meaning of the message. Pascoela is the Portugese name for Easter Monday (I think).

http://www.dtc.umn.edu/~reedsj/codebooks.html

> Until about 1905 the vast majority of code books supplied actual dictionary words (or artificial words) as their code words, such as ``Snatch = Sutter Packing Co., Yuba City, Cal.'' in the private code of the California Fruit Canners' Association, or ``Pascoela = Natives have plundered everything from the wreck,'' in the very popular general-purpose ABC Code, some supplied number equivalents -- sometimes instead of, and sometimes in addition to-- the code word equivalents.
>
> But in the first decade of this century code books began appearing with code words which were meaningless and often unpronounceable fixed length groups of letters, usually of five letters. Thus, in a later edition of the ABC Code we have ``ewvgl = Pascoela = Natives have plundered everything from the wreck'' and so on.

Pascoela is the Sunday after Easter, or alternately the week after Holy Week. I think the word is Portuguese; in English we call it St. Thomas' Sunday.

Could well have been the name of a ship that was plundered by natives at one point.

I found a scanned copy of the "Philips Code" on the web, don't remember where. The Philips Code was a compilation of the abreviations used by telegraphers and includes those for commerce and press use. It will show you the origin of currently used CW abreviations like 73 and 88 adn SK, which is really the number 30 translated from American morse.

Word codes, usually five letter combinations, were introduced to reduce cost for transmission and also increase speed especially via cable. Two widely used ones were the ABC code and Bentley's Code. I don't know if anyone has scanned and posted either. Both ABC and Bentley's went through many editions with additional groups added for new terms in the same way that dictionaries add new words. Each group could stand for a whole sentence. I have an ABC code book in deep storage somewhere.

Perhaps the text on: http://www.qsl.net/ae0q/ ?

The scanned version on a Canadian site doesn't seem to exist any more...

I assume you want some positive reinforcement to make you feel
good about owning this receiver :) It get's a five star rating on this

site:

http://www.dxing.com/rx/hq140.htm

Regarding the set only being single conversion on the lower frequencies,
that is not a problem. The double conversion provides improved
image rejection on the higher frequencies, but single conversion
probably offers stronger signal handling capabilities (less likelihood
of mixer overload.) Enjoy the radio.

Pete

And that sort of scheme was fairly common. Change one stage of the IF
into a mixer/oscillator, and get better image rejection on the higher
band (which is where they needed it). It was simpler than moving
to the scheme of a crystal controlled converter ahead of a receiver
that always tuned a fixed range and certainly cheaper. I'm not
quite sure why they didn't just keep the stage always in circuit,
your point about eliminating the extra mixer seems a bit much for
the time (when there was a lot less talk of such things).

The SP-600 did it, the later Heathkit transistor portable shortwave
receiver did it, I seem to recall even the HRO-60 did it (complete
with a microswitch that did the switching when the right coil tray
was plugged in).

    I checked this, its the same as I have except all in one
piece instead of three. Thanks for finding it.

Francesco,

Have you been able to find anyone to help you with your SX-146? If not, I may be able to.

First, please advise if you are attempting to rewire your transformer TO a 220 volt primary or change it FROM 220 V back to 120 VAC? At 120 VAC the high voltage output of the transformer is 165 volts AC.

I have owned and operated an SX-146 since 1966 and just this last year filled all of the optional slots. For the missing crystals contact Mel. at MH Electronics in California. He will cut you a superb quality crystal in HC-6 or HC-17 cases for only $18. Email him at ultramel@aol.com or call 909 989 1976. I've ordered from him twice in the last couple months and his turnaround has always been less than a week. He's a great alternative.Tell him I sent you.

I have found exact replacement crystal filters on eBay. Keep watching. I found mine for $5 apiece. I don't believe the sellers even know what they are. Use search words such as "FILTER 6 KC" "FILTER .5 KC" "CRYSTAL 6 KC" and "CRYSTAL .5 KC". Eventually you will find them.

By the way, I built a crystal calibrator using the schematic in the SX-146 manual. The original Hallicrafters socket is probably problematic although I found a professional microphone plug that used pins very close to those on the jack on the SX-146 chassis. Short of finding something like I did you might try just replacing the SX-146 crystal calibrator jack with one that is more compatible with the plug you install on your homebrew crystal calibrator.

Good luck.

I never thought about this until the matter came up in the HQ-145 thread, but what was the process of sending messages over the telegraph lines?

Suppose I was in a small town in Oregon and wanted to send a message to a small town in Nebraska? Is the message "broadcast", or does it go to a clearinghouse? Can anyone on the "wire" listen in? Are there relays?

I have been a ham for almost 50 years and I have no clue. There must be
some OT who are just waiting to tell me, or know a good website.

Thanks and 73, Colin K7FM

I think it depended on how complex the telegraph system was. There are some early telegraph handbooks available at Google Books. Most of the stuff that has been scanned and can be downloaded complete (rather than just sample pages) was published before 1900 to avoid copyright problems and some is not very well scanned, but its available.

Briefly, there was a clearing house or message center on larger systems (like Western Union) and most simpler telegraph circuits were "party lines" will all instruments connected in series. That's the reason telegraph keys have circuit closers on them. Any transmission from any station was heard at all of them. If an operator sent a message and forgot to close the circuit the whole thing was down until it was closed again. There was an alternative system with no steady DC in the lines but I don't think that was used much in the US. Seach around the telegraphy books for more.

Hello and please excuse the OT listing but this 1977 xcvr. is very rare and maybe a BA enthusiast/collector may have one.

After my previous posting for a copy of the manual, I now have the manual. Evidently, there were several loose schematics as part of the manual which weren't available with this manual. Within the manual was a referral to 2 sheets of shematics for Synthesizers and 2 sheets for RF Filter and Bandswitch. There may have been more.

If anyone has these schematic sheets, I would gladly pay for copying and postage plus any other reasonable costs that are part of getting these copies made.

Thanks for yor cosideration. Larry

I have an HQ-145X that I recapped a few years ago. I've not listened to it recently but remember that back when it was new I was rather disappointed by its mediocre stability on CW. But I was very happy with my HQ-110, which was a good ham receiver for its time.

The signalling is "point to point", and there would have to be relays to cut the effective line capacitance into manageable chunks in order to get a reasonable transmission speed.

The military method was "outstations" to "signal office", then "office to office" and finally to the recipient. Paper copies of the traffic would exist at each office, and be destroyed once the message had "cleared" (I.e: been transmitted to the next office in the chain and been acknowledged as having been received correctly.)

They also used multiple sets on a single pair for long runs, and yes: all the intermediate stations could hear the traffic - otherwise they wouldn't know when there was a gap in the traffic into which they could insert the offer of a message to another station.

A lot of civil traffic would be in code anyway - not to make it unreadable by the telegraph staff, but simply to cut transmission costs by having 5 character groups to represent standard words/phrases/paragraphs of contracts, etc.

>I have been a ham for almost 50 years and I have no clue. There must be

I've got some books on (the military side (British)) telegraph line construction and operating procedure, but not the civil side.

Chris.

I have a ZENITH T600 "Transoceanic" shortwave radio in original condition that is surplus to my needs. It could use a cleaning but is 100% original.

It receives signals reasonably well but could use a going-over to make it perfect. Dial cord works but slips slightly on occasion. This can be repaired without removing the dial cord by a simple application of rosin, found in any music shop.

Cosmetically it is in excellent condition. A nice cleaning up and application of shoe polish will make this baby sparkle.

I am asking $125.00 for it plus packing and shipping costs.

If interested please reply by e-mail.

Thanks,

73,

Michael

I don't think capacitance was so much the problem as just plain resistance. Telegraph systems used repeaters at periodic locations. There were several variations of repeaters, some simplex and some duplex, but all were arrangements of sensitive relays. There were also two variations of sounders, local and line, varying mainly in coil resistance. Typical local sounders were about 4 ohms, line sounders could be anything from about 20 ohms to maybe 150 ohms. I have a maintenance sounder from Western Union which is 400 ohms.

Line loading came fairly late when high speed and multiplex telegraph systems began to be common. As with telephone service periodic loading increased bandwidth (and hence speed) at the expense of greater overall loss.

There are several sites on the web dedicated to old telegraph equipment and a number of technical handbooks available in PDF form from Google Books (free downloads but some are not scanned very well).

I have restored a 140X and I live it. Use it mostly on 160, 80 and 40 as well as casual SW listening.

Hi All;
A friend of mine has a DX-100 that is working but the loading control
switch has a few hot-switched contacts.
He wud like to make it a DX-100B, I think they made a kit to do that.
Anyone have one collecting dust?
Thanks es 73....Rich WA2RQY/4 (1961)

I have seen one, but like most kits they are extremely rare - maybe
better to look for a junker DX-100B or Apache - IIRC the main item in
the kit was the dual 365mmF loading cap

I am restoring an SX-28 that has the 6J5 Beat oscillator tube replaced
with a 6SN7GTB(Mullard!)
that is apparently working with the 6B8 2nd detector in an infinite
imedance detector arrangement. There is a switch installed next to the
tube. The radio goes silent when the switch is in one position. Do you
suppose the silent position is for operation with the original 6J5? I
don't have documentation, and tracing the modded wiring against the
original schematic is extremely difficult.
Wide bandwidth AM reception with this detector is pretty startling-
exceptional high freq response.
But poor AVC action, constant RF gain tweaking, and cranky SSB
operation appear to be the tradeoff. Does anyone have any recollection
of this mod for the SX-28? Was it documented anywhere?
Thanks!
Ben

My small town in Oregon was Eugene, and I worked for what was then Pacific Tel and Tel, in the Toll Testroom. We cared for all the long distance hardware and circuits.

in the mid 50s we were encouraged to use the telegraph "order wires" for inter-city maintenance communications, as the voice circuits were revenue producing and they were in short supply. From Eugene I could instantly "talk" with any or all major towns between Seattle and LA. The circuit was a party line, where all offices heard everything and could break-in. Within a couple years, it was replaced by a voice orderwire, with loudspeakers in each of the offices so the people could hear the shout-down calls.

Officer discretion based on experience (or accumulated frustration
or bad attitude) teaches them to react autonomously such that
any outcome is possible, ranging from looking the other way to
field execution.

http://homepage.ntlworld.com/richards_internet/RADIO/618_CAS.html

I've just altered my webpage to answer one of your questions.

About the price. Well, If remember correctly some months ago I think this outfit (not my actual outfit of course) came up on Ebay and it went for a price that makes me feel I should start a bid off at �500. Wow! I know, a lot of money. I don't know if the price the other oufit realised was a freak or what. Ebay is such a funny place sometimes regarding what things fetch.I just seen that a CODAR CR45 went for �166!

> Hi All;
> A friend of mine has a DX-100 that is working but the loading control
> switch has a few hot-switched contacts.
> He wud like to make it a DX-100B, I think they made a kit to do that.

The kit actually converted the DX-100 to a "DX-100A". (There were no DX-100As from the factory). The modification kit did indeed exist; I have seen it referred to as the "Mk.3" kit, though its real name is probably something else.

There's enough room inside a DX-100 that a homebrew mod could probably be done by replacing the existing coarse loading switch with a dual or triple 365 uuf variable. Probably need gear or pulley drive for it.

73 de Jim, N2EY (wondering why I ever sold my DX-100....)

OK, thanks Richard,

If you do put it up on ebay please post a link on this site and
uk.radio.amateur.

Cheers,

'BF

Hi

It's a bit fluid I guess at the moment about what I would do about splitting up the parts. I would not want to be left with some part that was hard to get rid of or that I got much less money than I could have. I was thinking that if somone wanted the whole outfit it might command a better price, because it can be a pain to get all the units together. I assumed the reason the other outfit that was sold got such a good price because it was a complete set of units. But, not everybody is looking for all the parts. :c)

I'll post a link when and if I put it on Ebay which should be soon.

Rich

My S-36/RBK-13 has thrown a shoe. The small drive gear that is on the shaft turned by the main tuning knob has split. I wonder if anyone has parted out an S-36 and has the shaft assembly. This is the shaft that also carries the stop cam. Replacing it looks its a lot of work but possible.

I will have a shot at repairing the original with super-glue but I doubt it will work.

This receiver has been a constant companion for some 30 years so I would like to keep it alive if possible.

Seems from what I can find, the -4 RBM was the .2-2.0mcs version & the
-5 was the 2.0-20mcs version.
I have the -5 with those large engraved letters on the knobs.
Thankfully I also have the AC power supply es cable.
Someday I gotta bring it up on a Variac es see how she plays:-)

ok jeep;
I went & checked my name plate.
I had said RBM when you were right, it is an RBS.
My plate is marked CCT-46217, made by stromberg carlson.

I have a ZENITH T600 "Transoceanic" shortwave radio in original condition that is surplus to my needs. It could use a cleaning but is 100% original.

It receives signals reasonably well but could use a going-over to make it perfect. Dial cord works but slips slightly on occasion. This can be repaired without removing the dial cord by a simple application of rosin, found in any music shop.

Cosmetically it is in excellent condition. A nice cleaning up and application of shoe polish will make this baby sparkle.

I am asking $100.00 for it plus packing and shipping costs.

If interested please reply by e-mail.

Thanks,

73,

Michael

Hi Gang:

This is a nice very clean original RCA SC-13 RCA Transistor manual from 1967. There is no writing inside and there are no missing pages. In fact I would say that it is in EXTREMELY FINE condition for a 40 year-old book.

I'd like to get $12.00 for it plus postage. Any takers?

If interested please reply by e-mail.

73,

Michael,

Hi Gang:

I am downsizing my collection and thus have this very nice set of radio books from a correspondence course from the 1930s that are surplus to my needs. So I am offering them up for sale.

The following 6 titles were published by the International Textbook Company of Scranton PA for the International Correspondence School, ICS.

1. RADIO FUNDAMENTALS, 1933
2. ALTERNATING CURRENTS, 1935
3. DC CALCULATIONS, 1938
4. ELECTRICITY AND MAGNETISM. GENERATORS, 1928
5 MEASUREMENTS, REGULATION, BATTERIES, 1928

All books are in very good condition. I am asking $20.00 for the set plus shipping or $5.00 per title. I will give priority to anyone wanting the set.

If interested please reply by e-mail.

Thanks and 73,

Michael, W1RC
